

Lego 42110

Land Rover Defender

Installation Guide

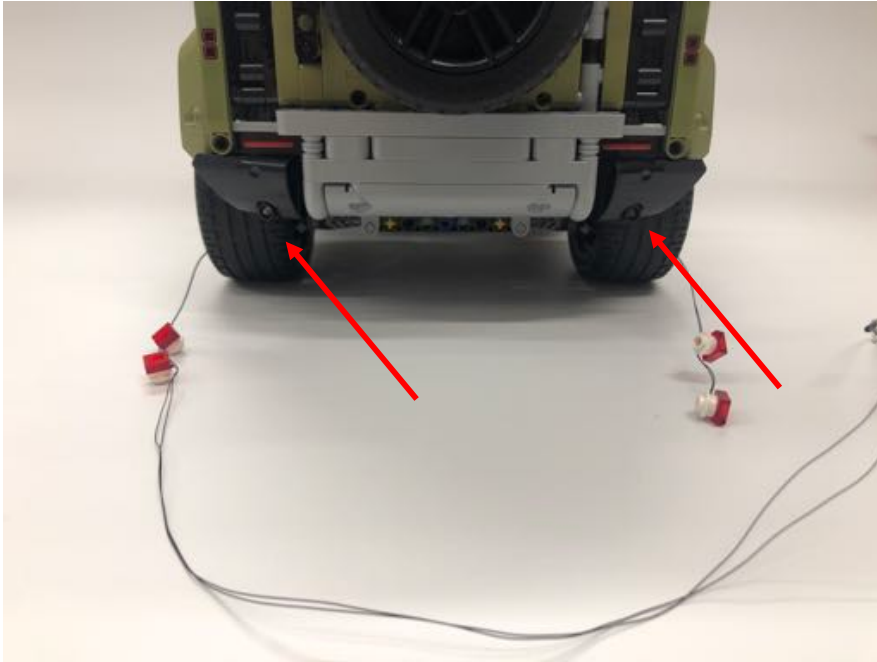

Start with the rear light part first

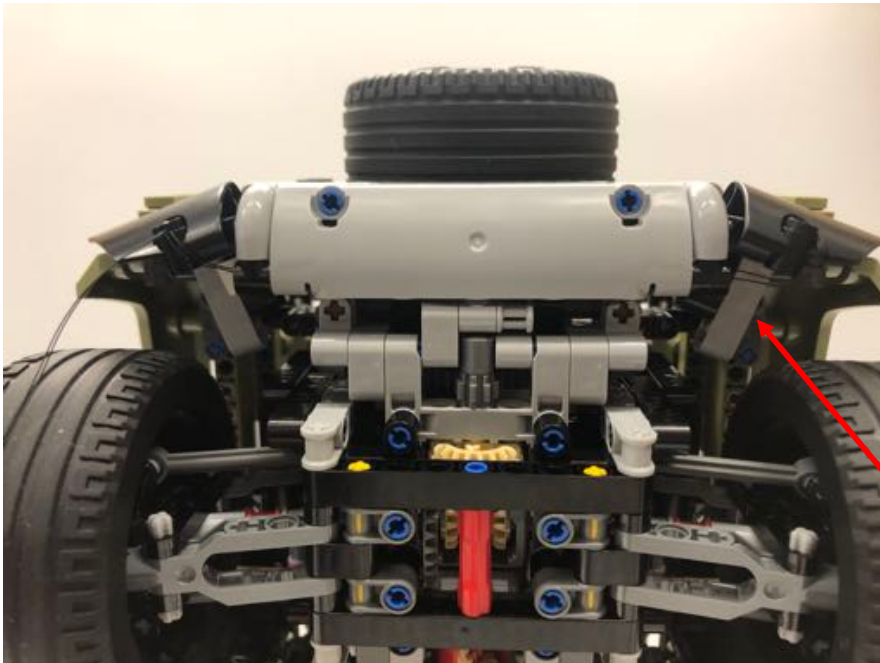

Take the red square plates with white round plate away

Install the black round plate lighting part as shown

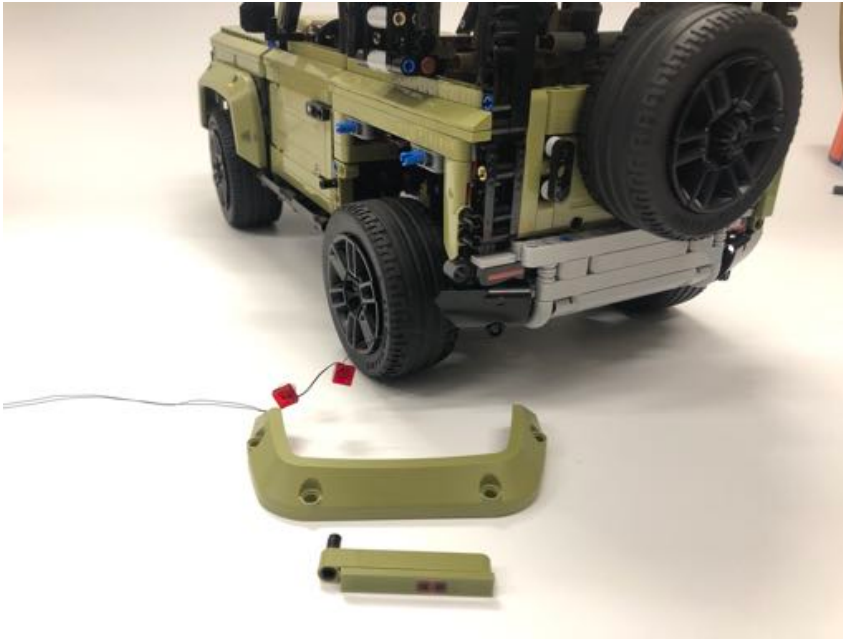

Hide the wires connecting the black round plate underneath the grey part

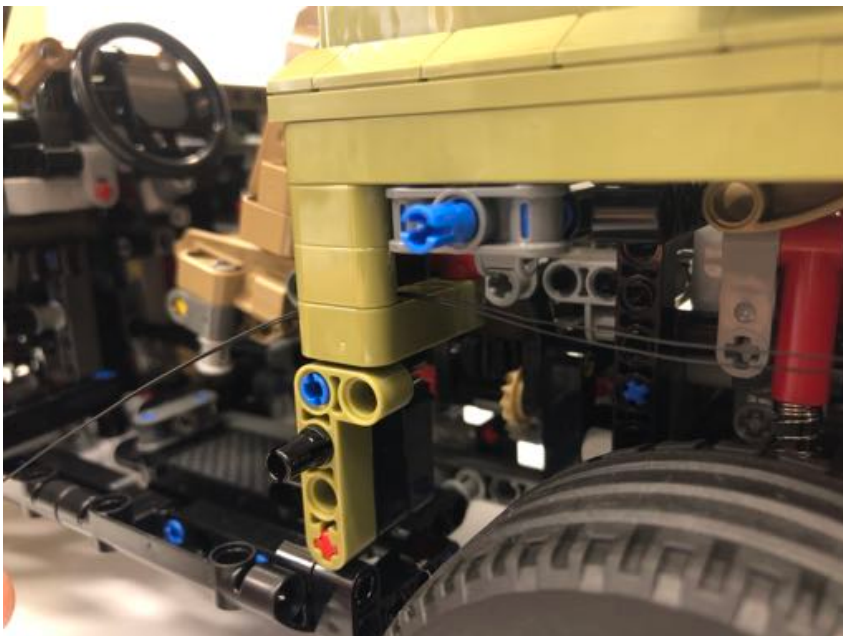

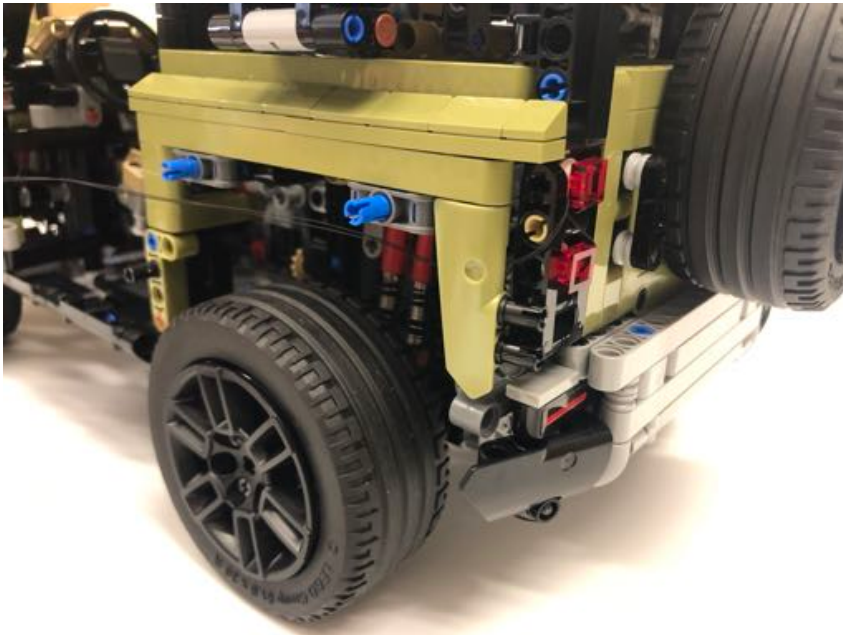

Install the red lighting parts

For the other side of the light with connector plug, remove the parts shown in purpose to pull the wires to the front

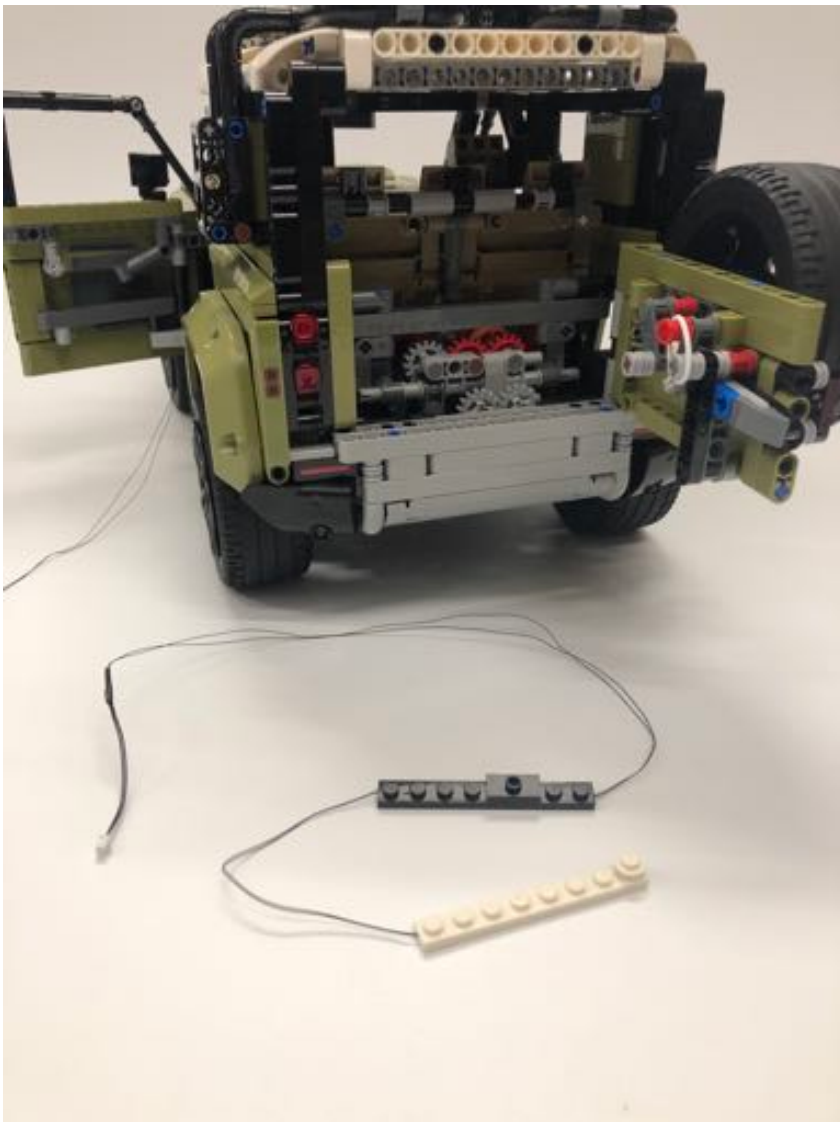

Install the lighting parts and adjust the wire to the front

Restore the green parts after the wires moved under the driver's seat

Now it's turn for the interior lights

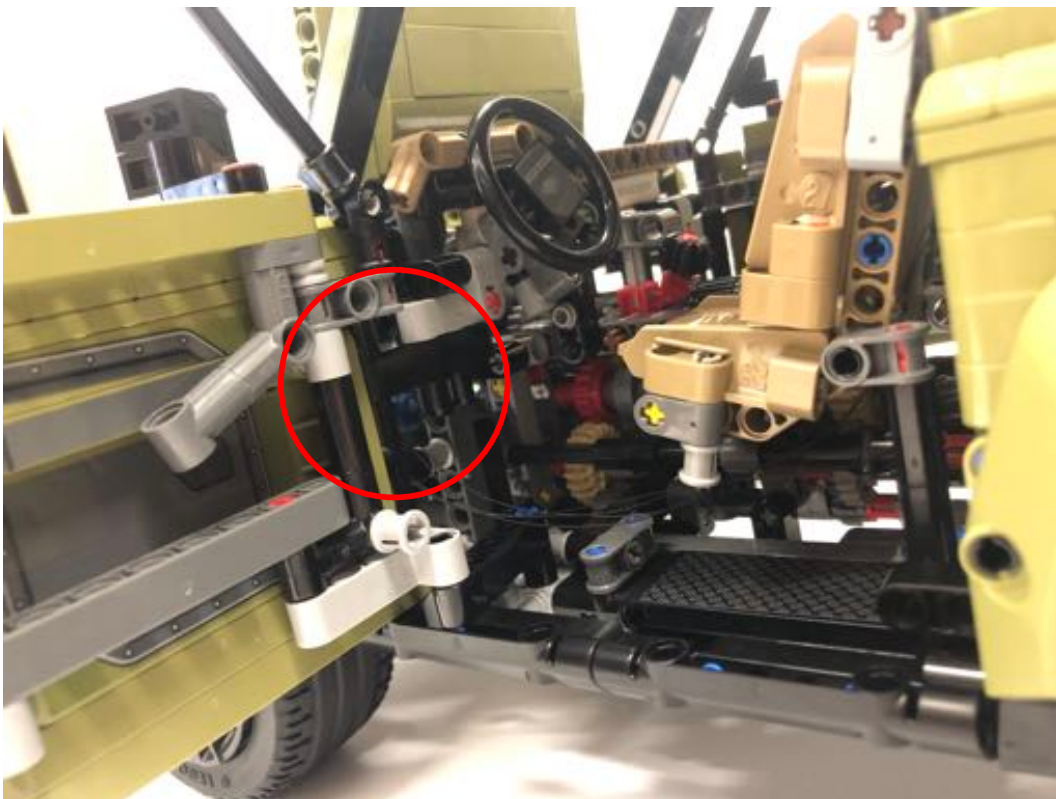

The white plate lighting part should be installed on rear seats side and black lighting parts on front seats side

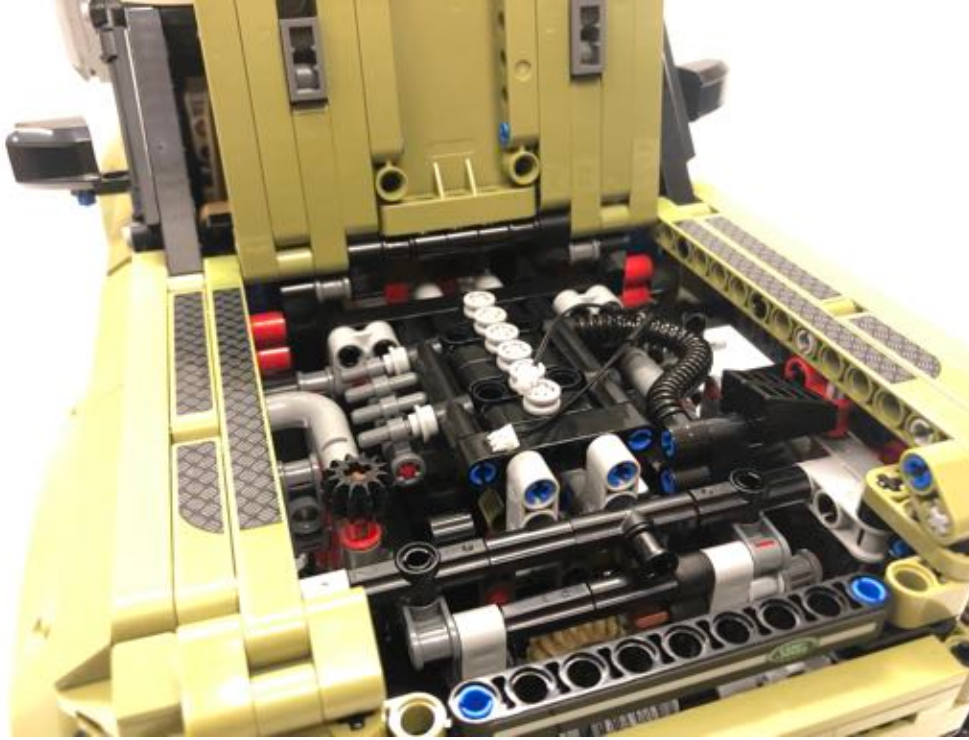

Adjust the connectors of 2 previous parts together

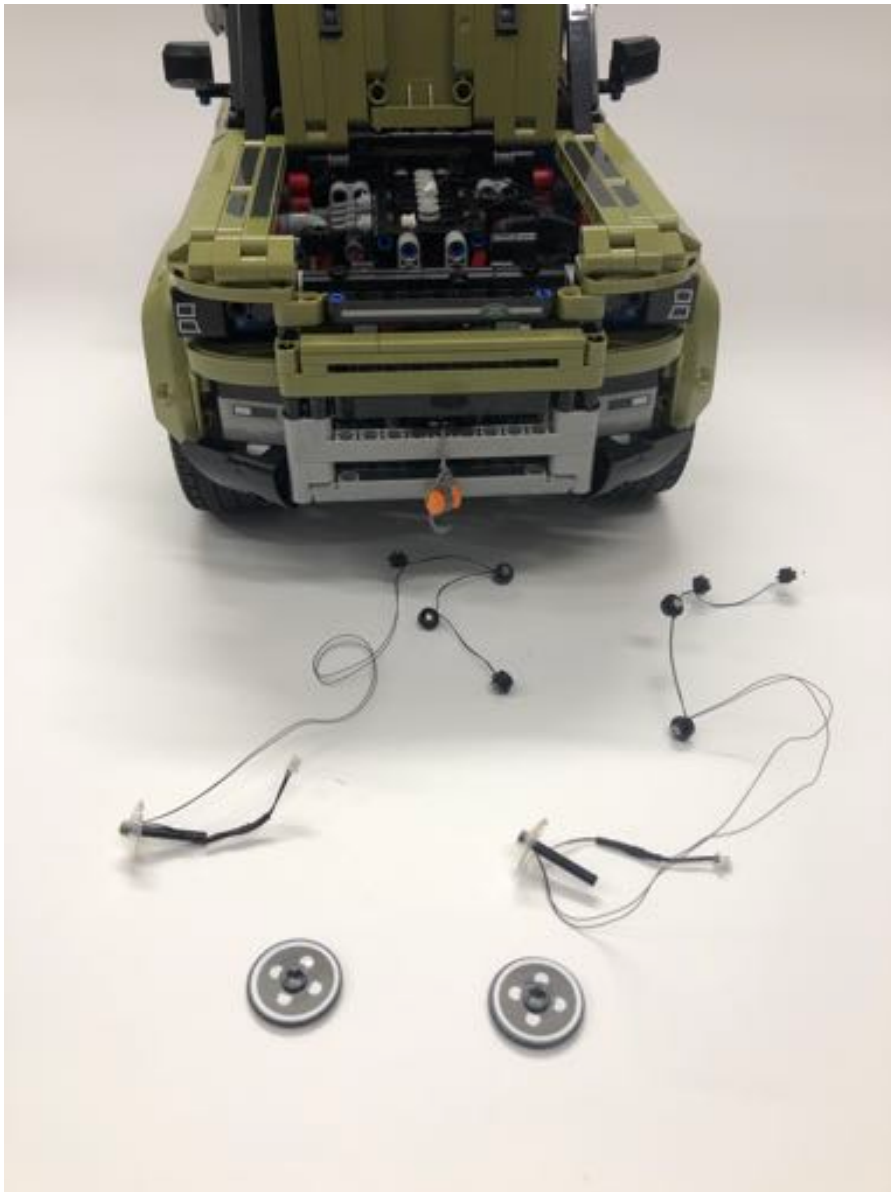

You need to move both of the connector plugs to the engine area, and there's a hole in the red circle below to get them through

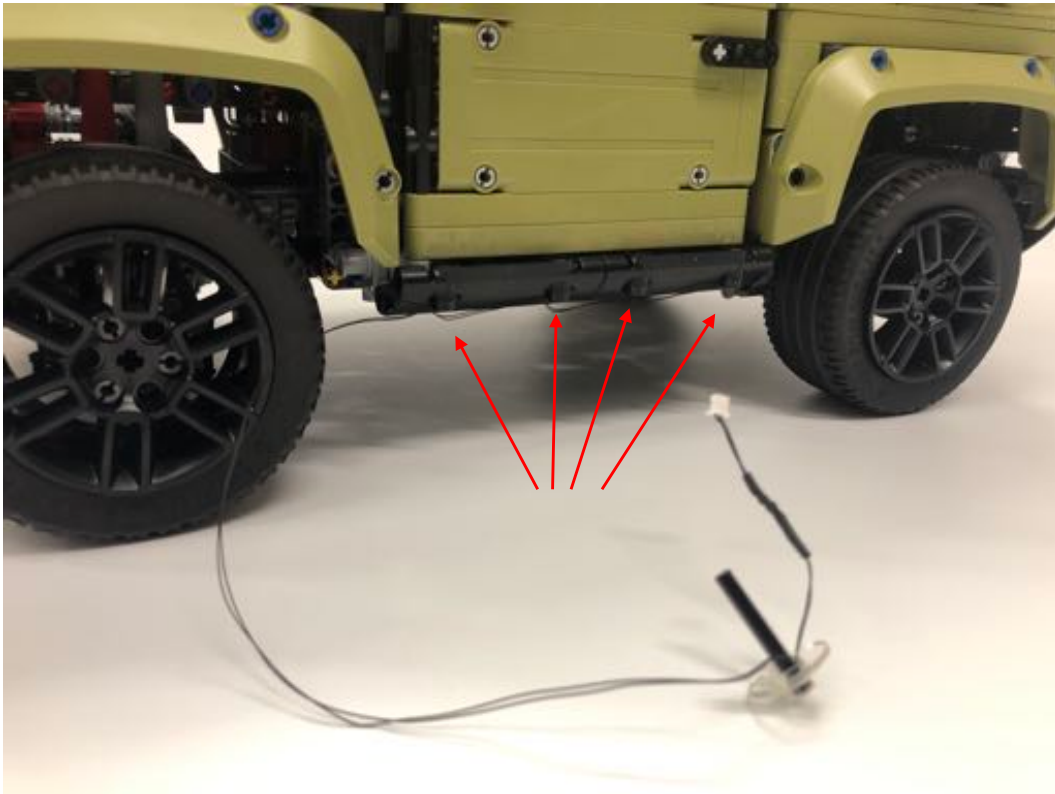

Get the plugs on engine then we can go to the next step

Take the front lights away, separate the black dishes to assemble with the lighting part

The lighting black round plate will be installed on the side of the vehicle

Remove the green parts as shown to move the front lights to the front

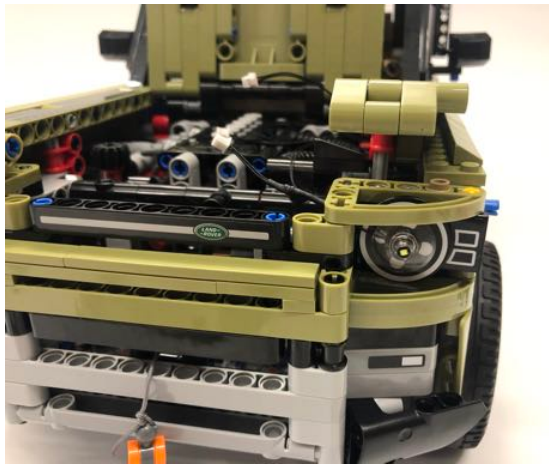

Adjust the wires to the front and remember don't let them stuck to the wheel to interrupt when they're spinning

Now you can install the front lights

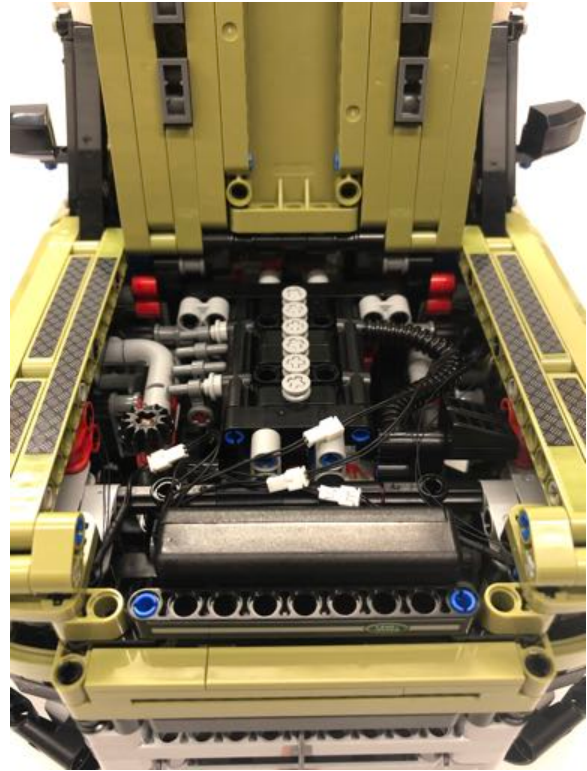

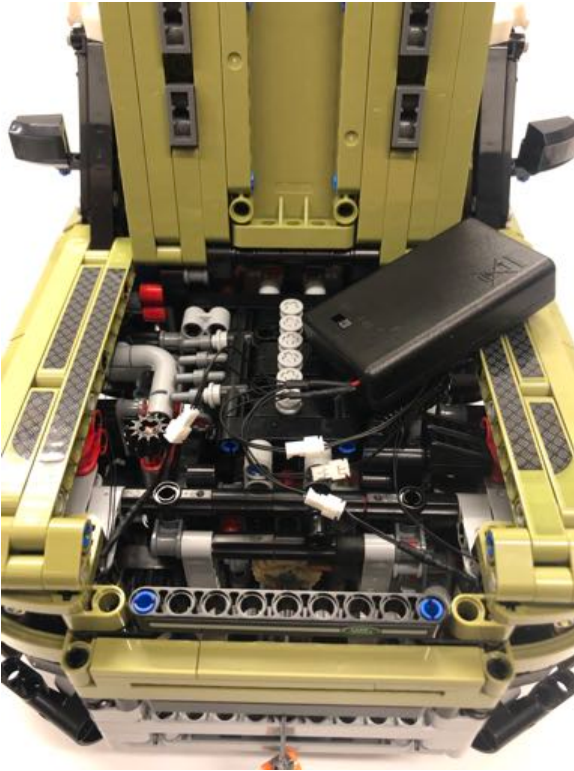

Restore the green part after the light is installed

Repeat the previous step on the other side

Now you can connect to the power, you can choose either battery case or USB cable
Can put the battery case as shown

This is how to connect by USB cable
