

# Lego 40573

## **Christmas Tree**

### *Installation Guide*

Firstly separate the tree as shown, and for the lighting kits to distinguish which one it belongs to would be the orange round plate with a LED bulb attached, that's for the top

Now let's start with the top first

Take the top end part away and detach as shown

Assemble with the lighting part

\*the gold round plate would be switch from the front to the back or you can just throw it away

Now put it back on top and the wire can be hidden by the removing a green plate underneath

Now assemble the two red lighting round plates under it's original parts  
As shown in the picture, you can lift up the top to hire the wire in between the plates

Then assemble the yellow lighting parts, lift up the stars put the round plates on and put the starts back onto the lighting round plates

Now move it downward to assemble another red light  
Remember it's done by layer to layer, never jump to other level until you finished filling  
up the red/yellow light on the certain level

Now to the level with 2 reds 2 yellows

At last, assemble the four lighting flames on the candle

After assembling you may realize the 2 reds and 2 yellows at the bottom have no lights, don't worry they would be filled up by the other lighting parts

Now it's turn for the bottom area

This time we would start from the bottom end

After assembling four candle lights then do the red round plate at the upper level

Basically just follow the red/yellow parts located level by level to do the assembling which is very similar with the previous steps

At last, there should be four lighting round plates left

Now combine the tree and assemble the four lights leftover to the bottom end of the top half

At last, connect the two connectors to the USB cable
