

LEGO 75352

**STAR
WARS**

Emperor's Throne Room

Installation Guide

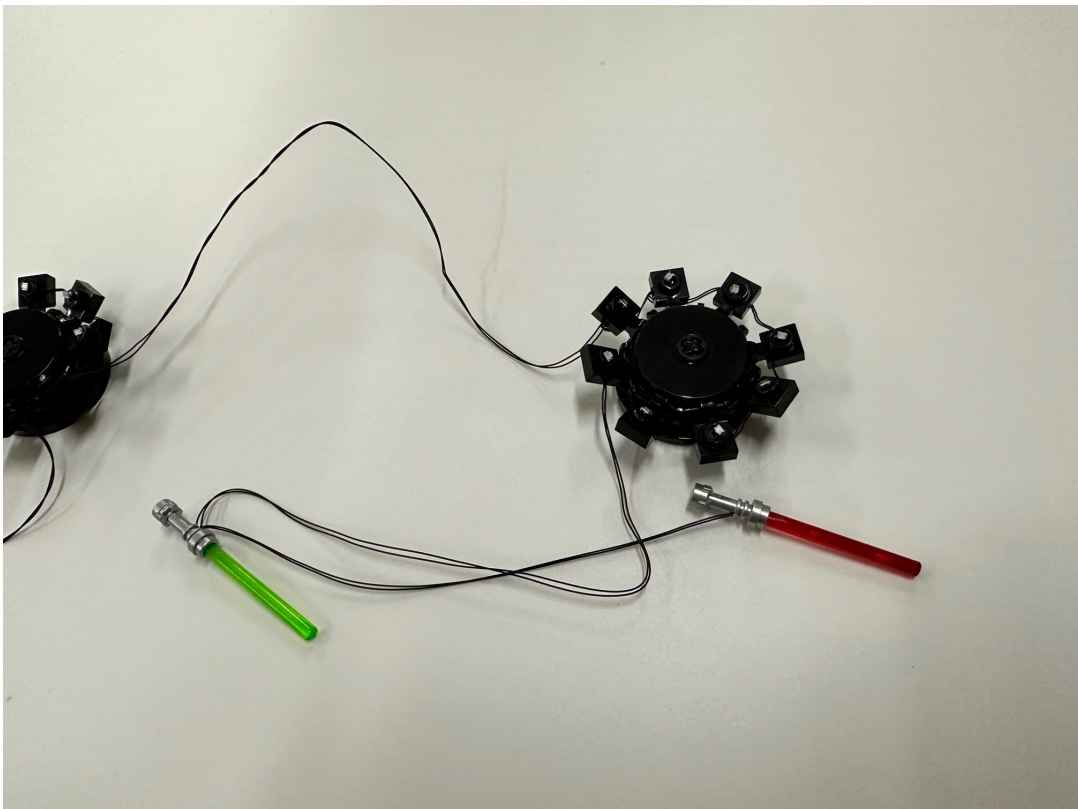

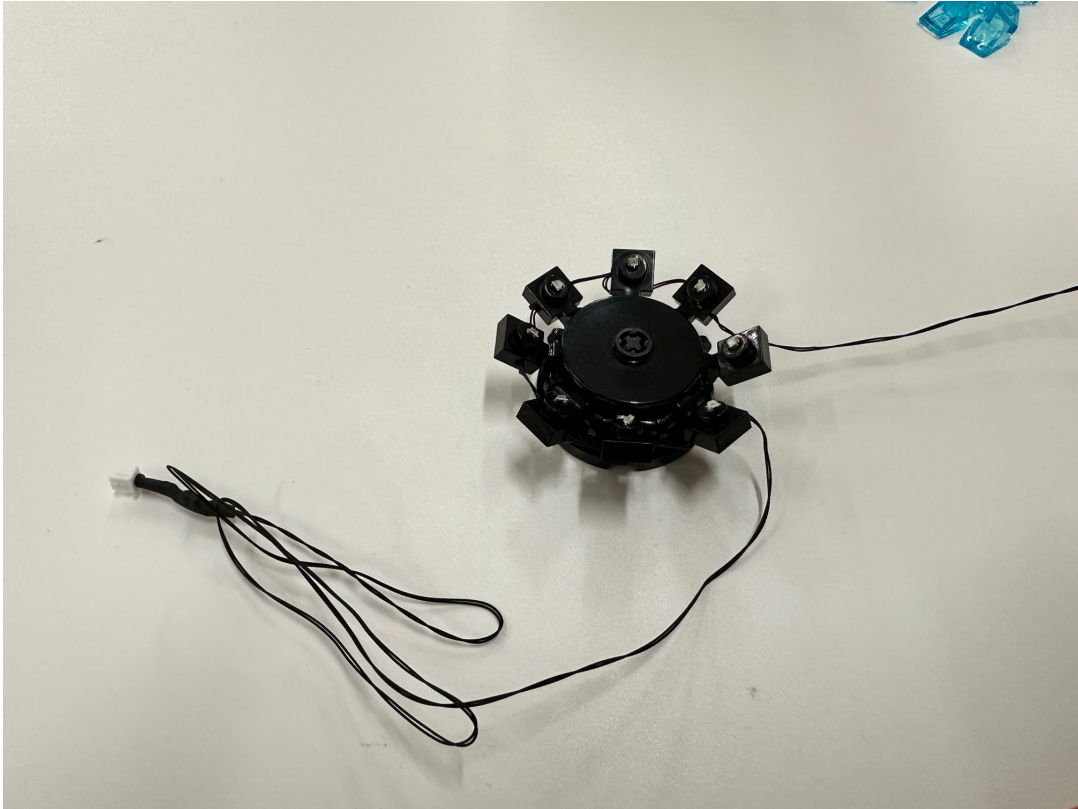

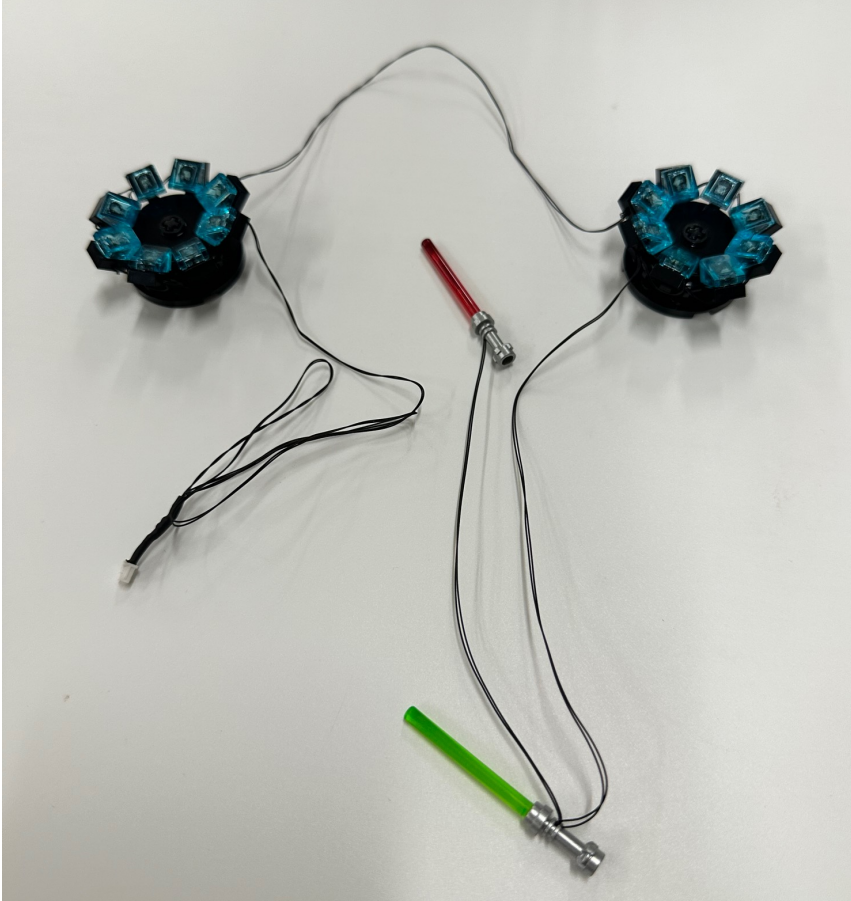

First of all, remove the stands on both sides and split all the parts
Take the black clips away and leave the remain parts here

Assemble the black lighting clips on one side of the stand
Then move it to the other side and assemble them

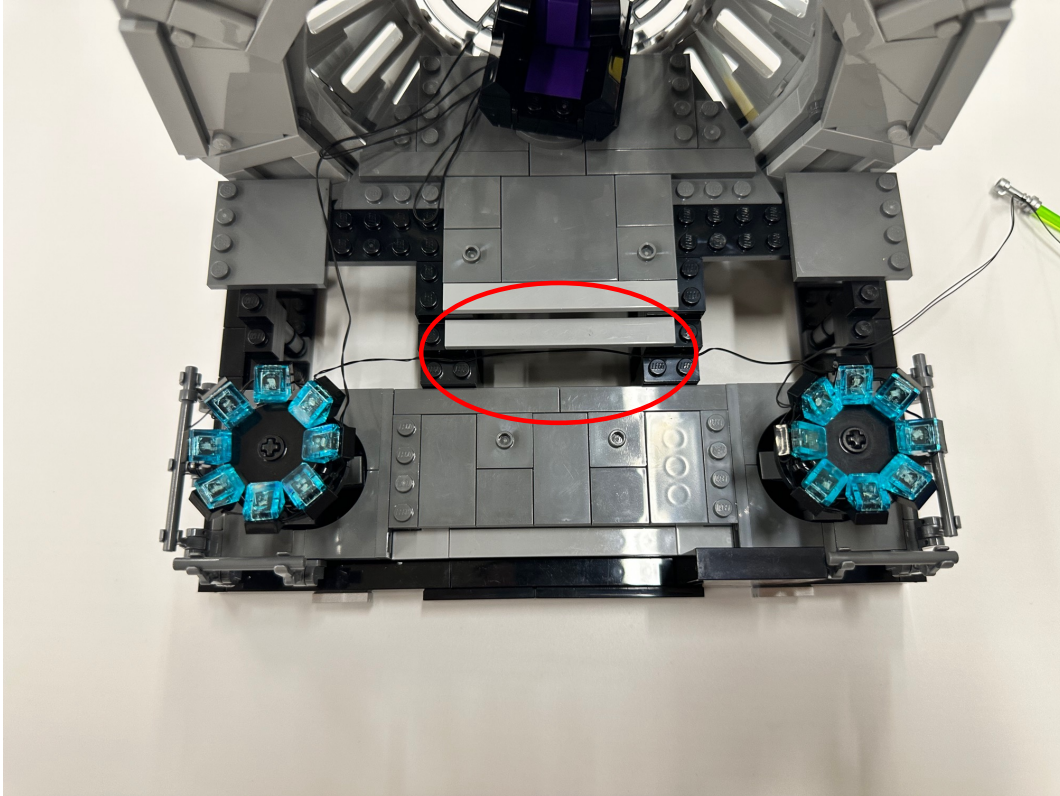

Put the clear blue slopes back on the stand

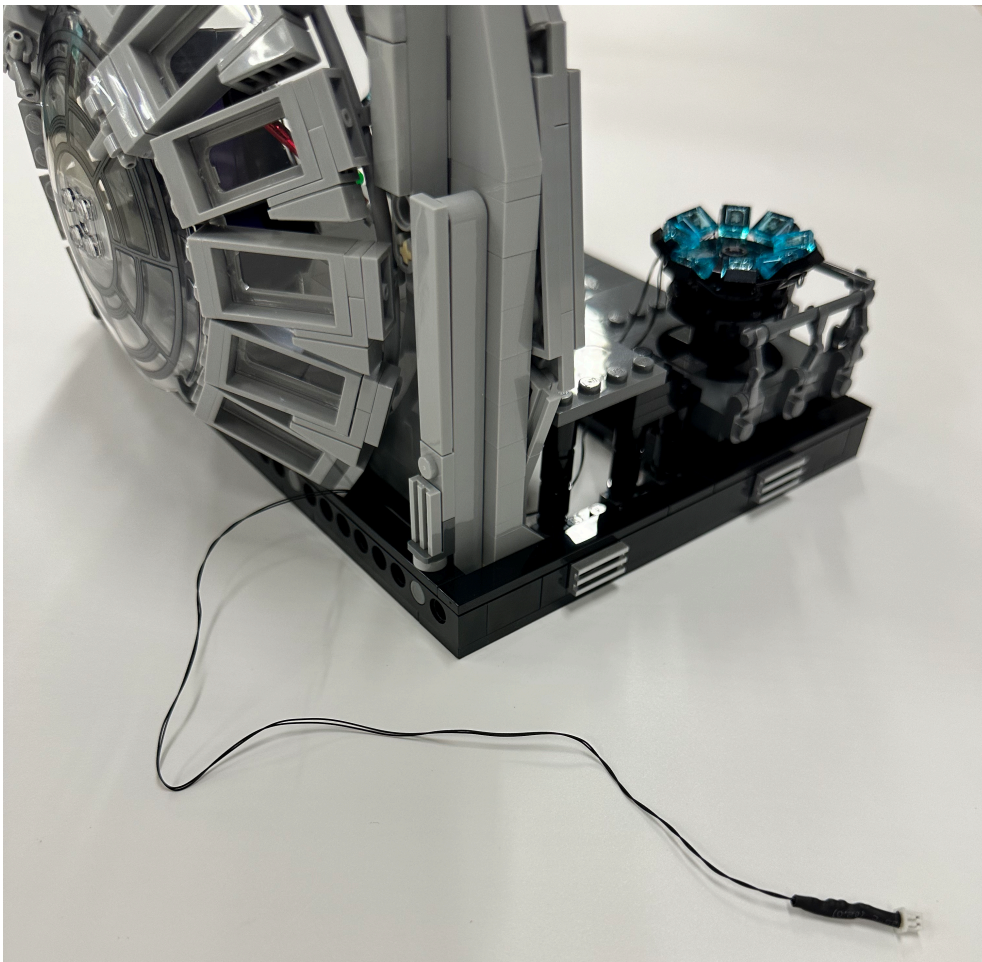

Before restoring the stand, remove some tiles on the base to leave space for the wires

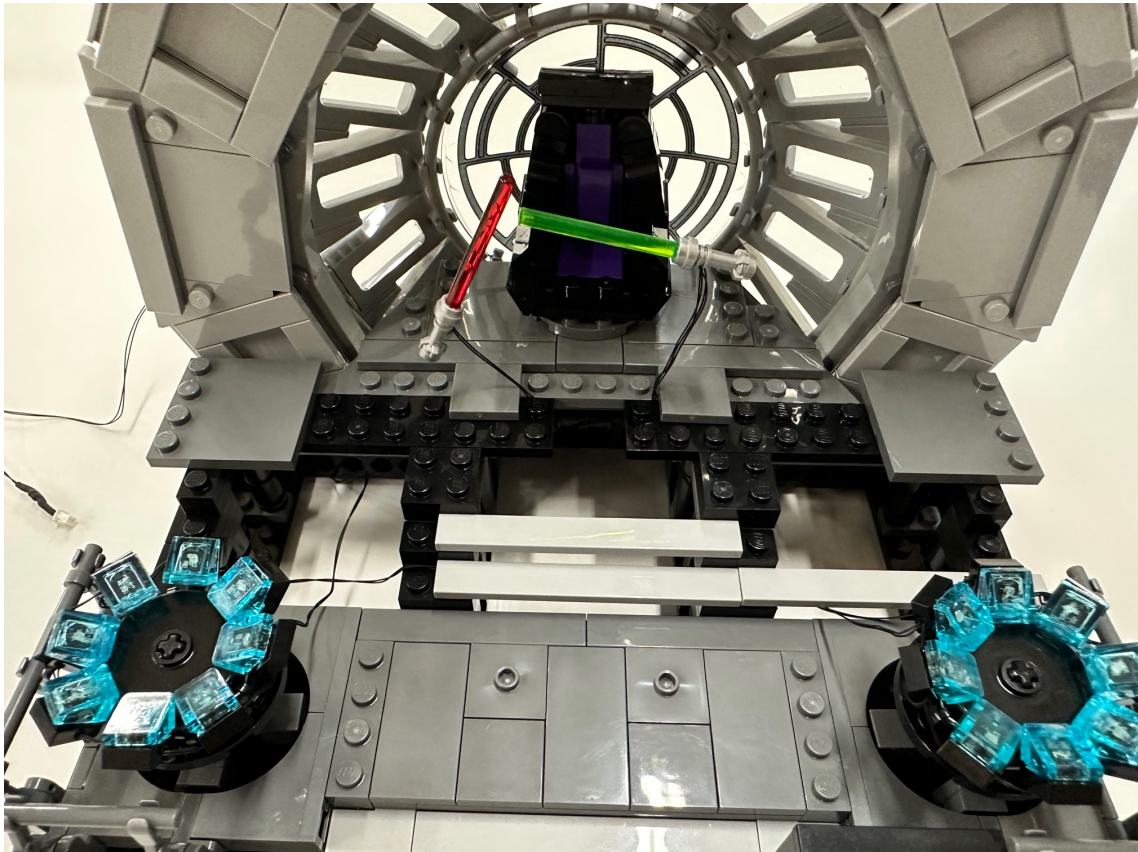

Now put the stands back on the base, the wires in between them could be hidden under the tile on the middle

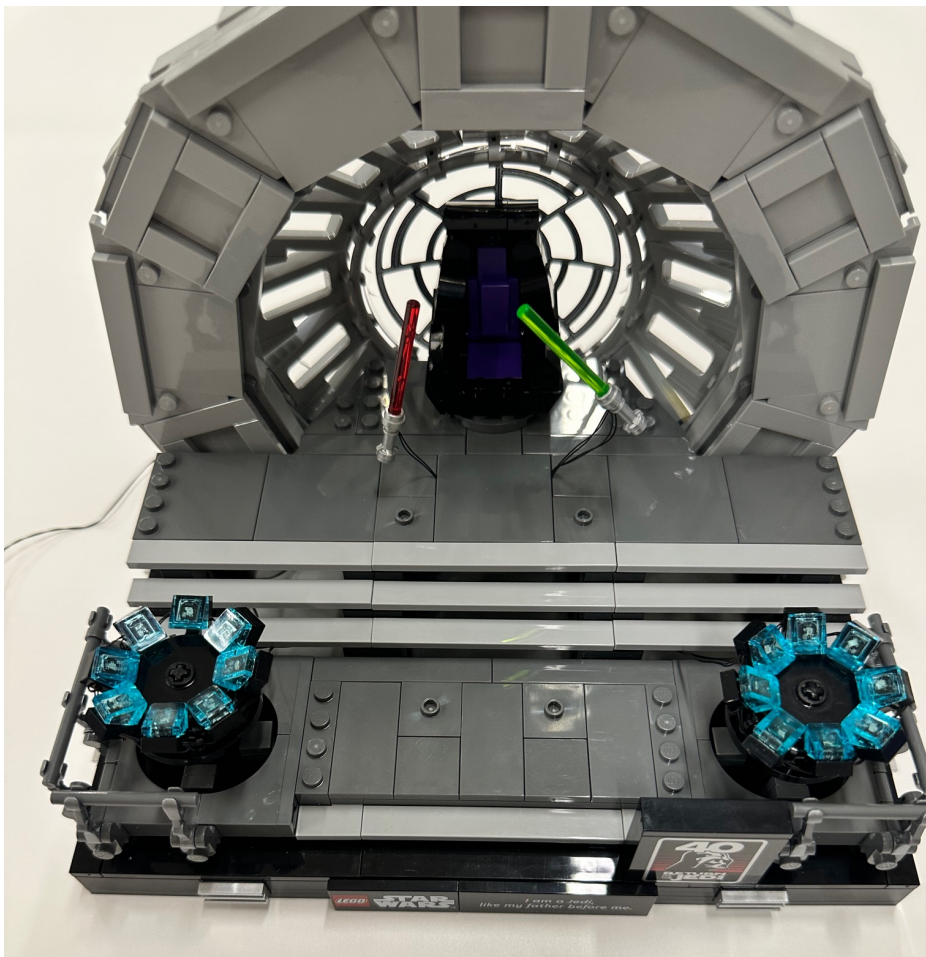

The connector will be moved to the back of the whole model, there's space at the back to make the wire get through

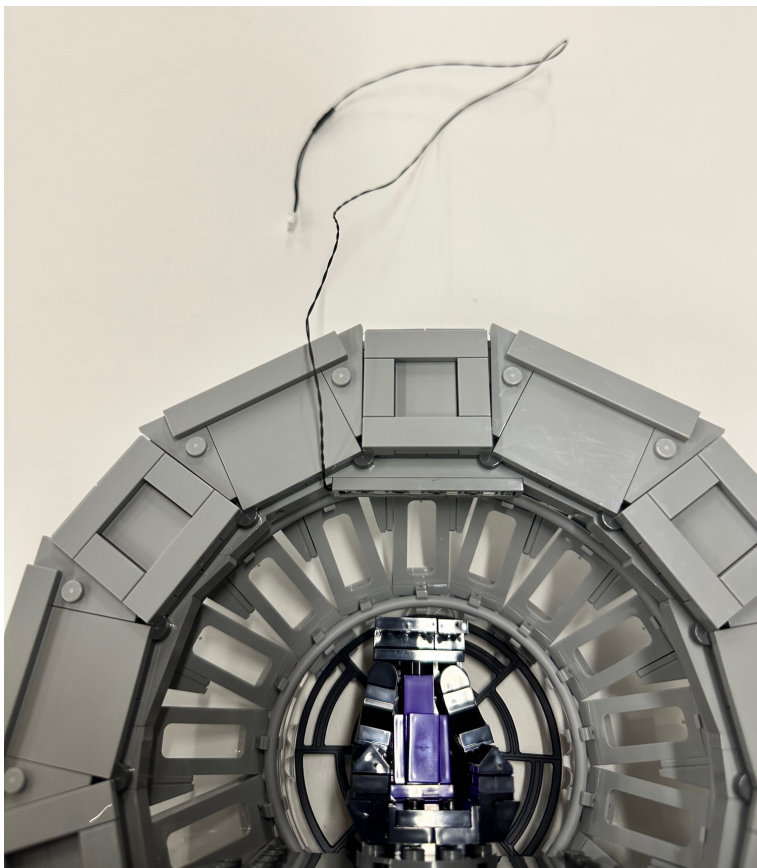

Now move the sabers to the front of the throne
Remove the tiles and plates to get them through

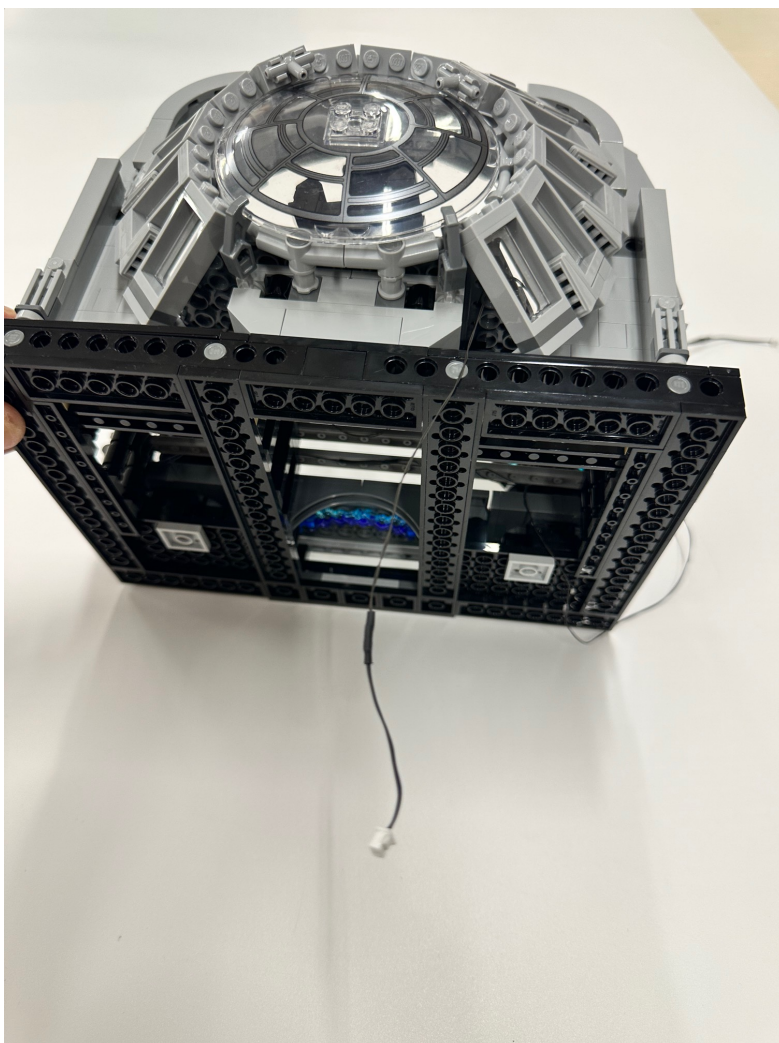

After the sabers to placed on the correct position you can restore the tiles

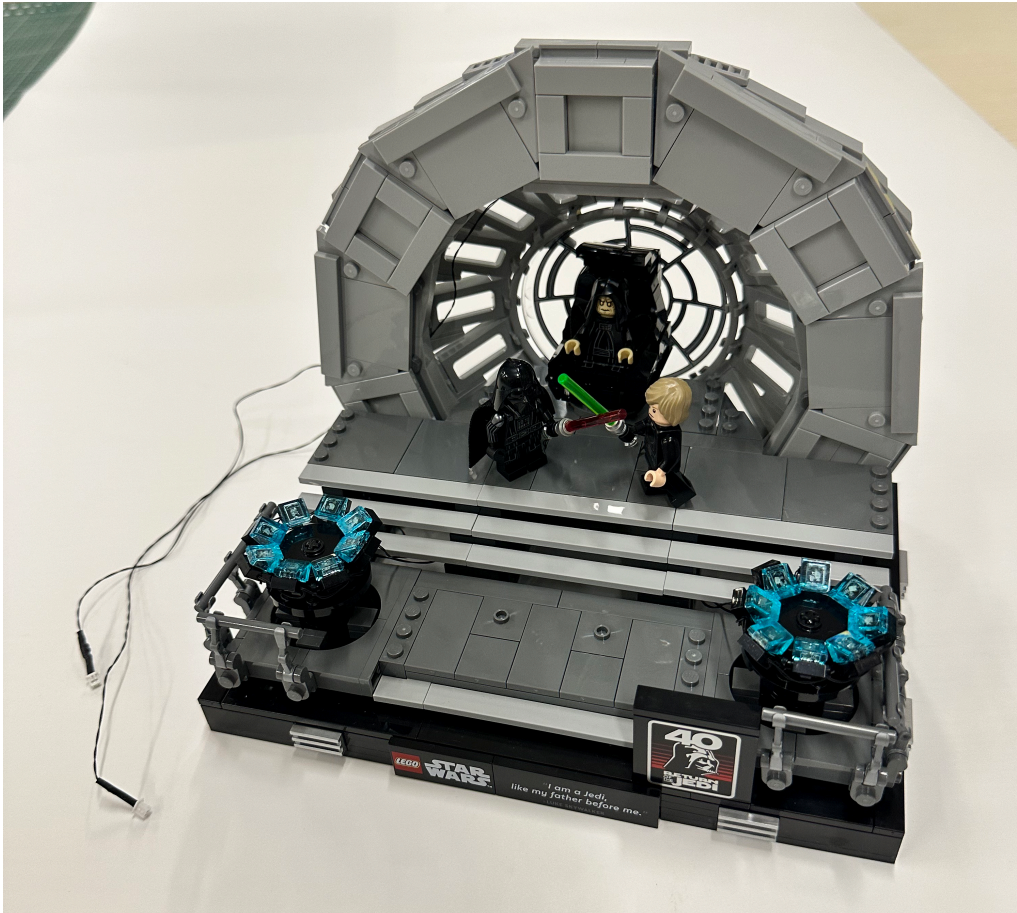

The remain lighting plate would be assembled on top of the throne

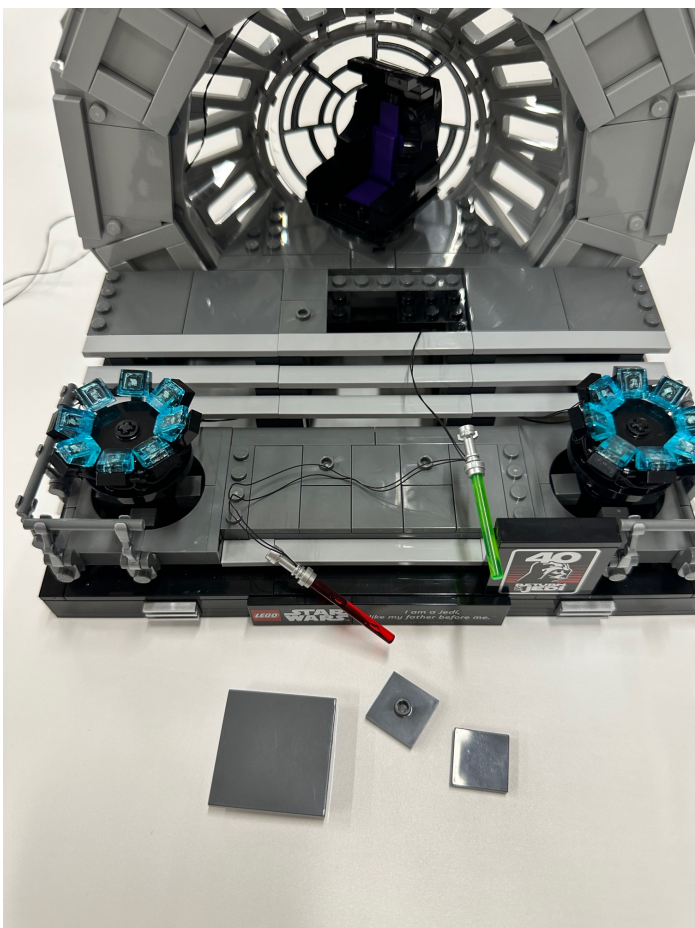

Then move the connector get through to the back

Put the minifigures back on the model
Then the installation of the light is basically done

However, if you dislike the position of the sabers placed, you can remove the shown tiles to release the sabers and place them to where you like

After the sabers are settled, restore the tiles removed

At last, connect the USB cable to power up the lights
