Installation Guide

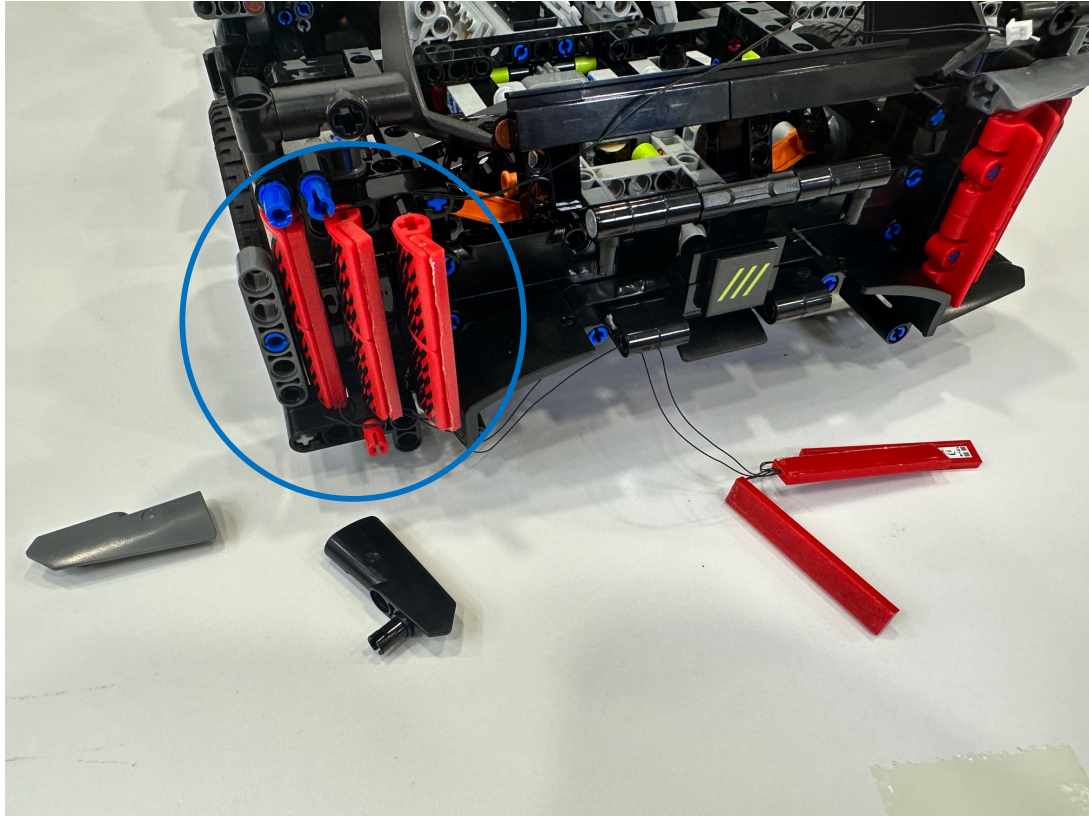

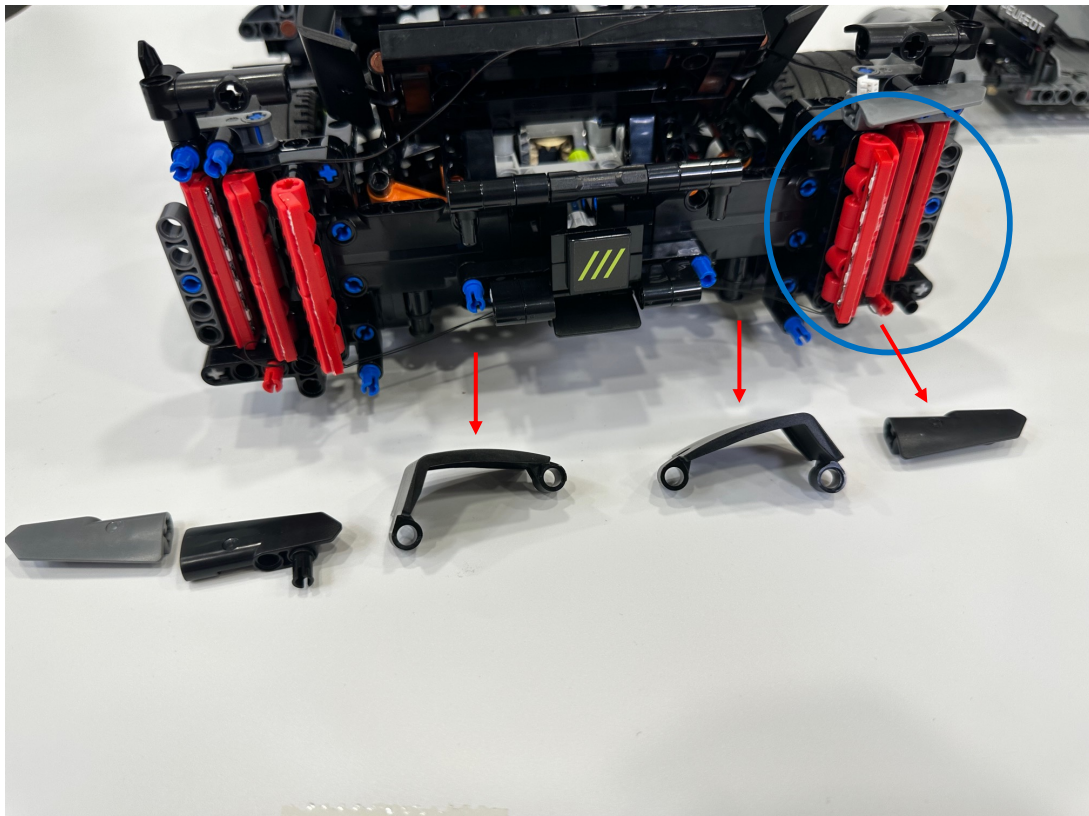

Start from removing the cover at the back and get the red lighting tiles

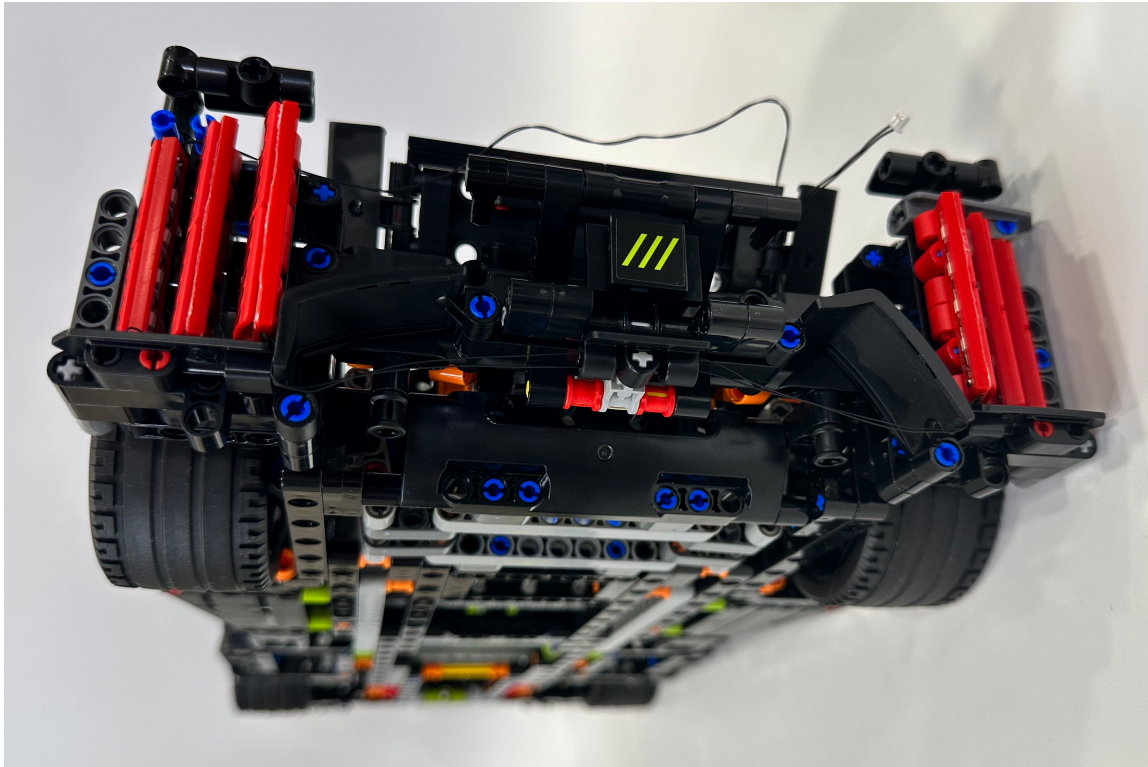

Remove the shown parts and stick the lighting tiles with connector attached at the brake lights, remember the wires connecting to other lighting tiles should be facing at bottom

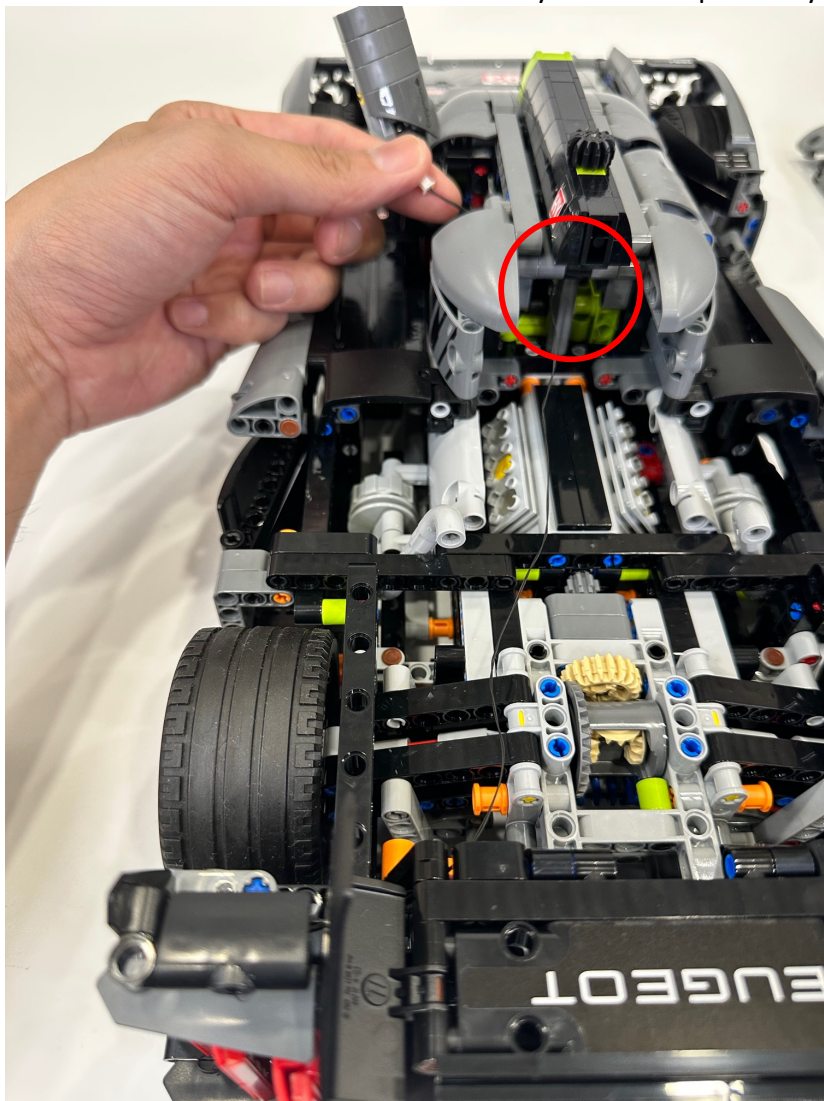

Remove the shown parts, move the remain lighting tiles to the left and assemble them

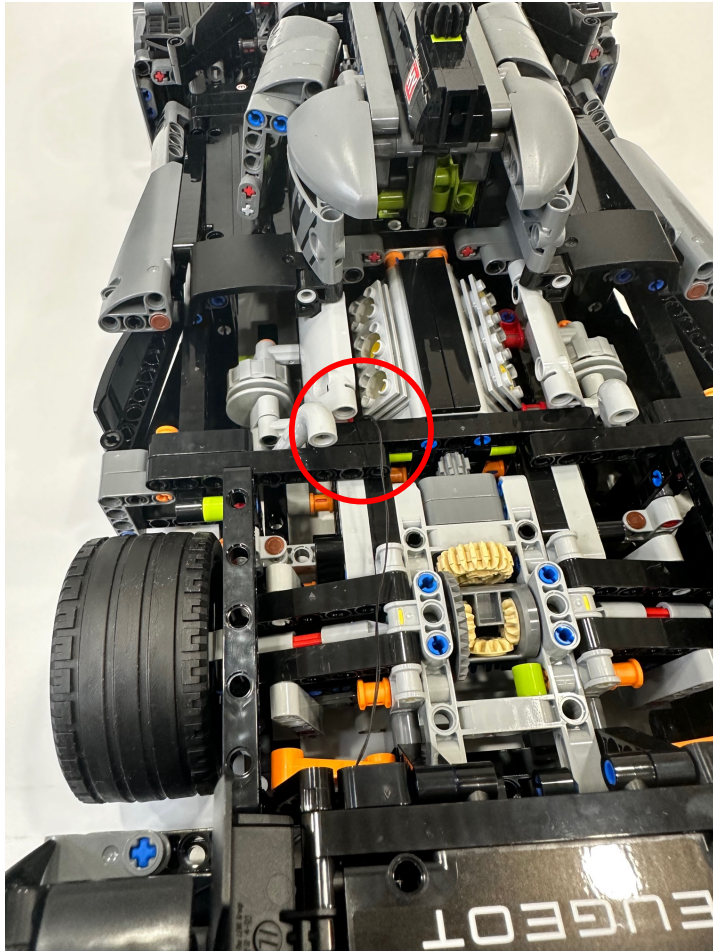

Place the wire at middle to be stable and less visible then you can restore all the parts

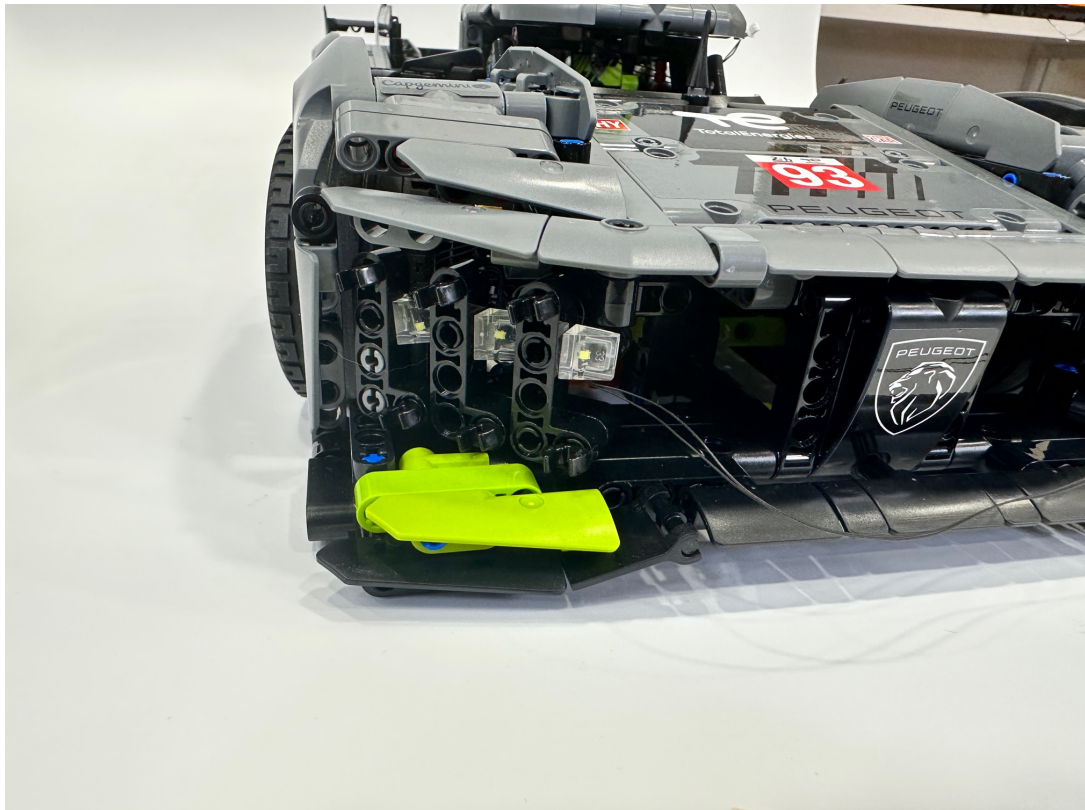

For the connector, it would be placed differently depends on which kind of power source you want to use
Move the connector to the driver seat if you want to power by battery

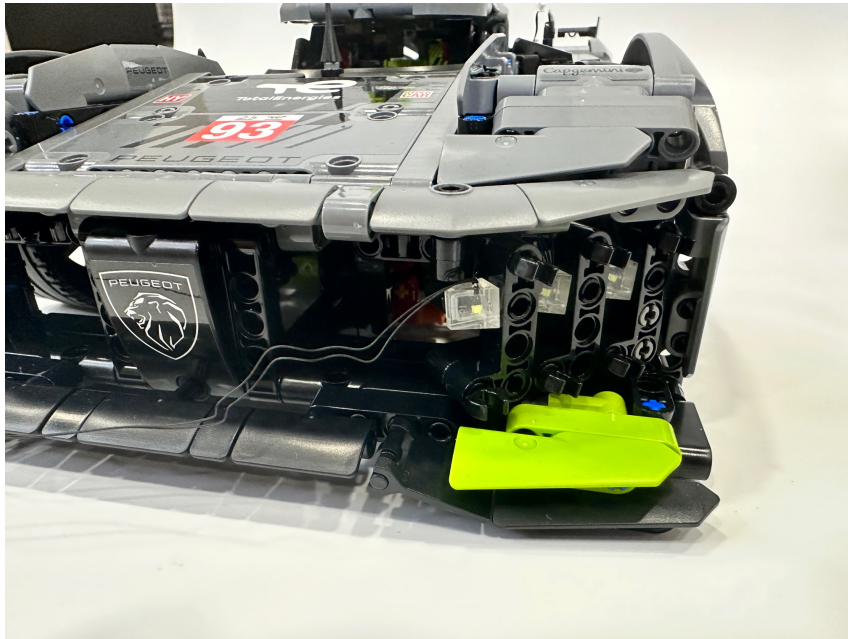

If you want to power by USB, please move the connector to the bottom of the car
There's a hole right besides the engine

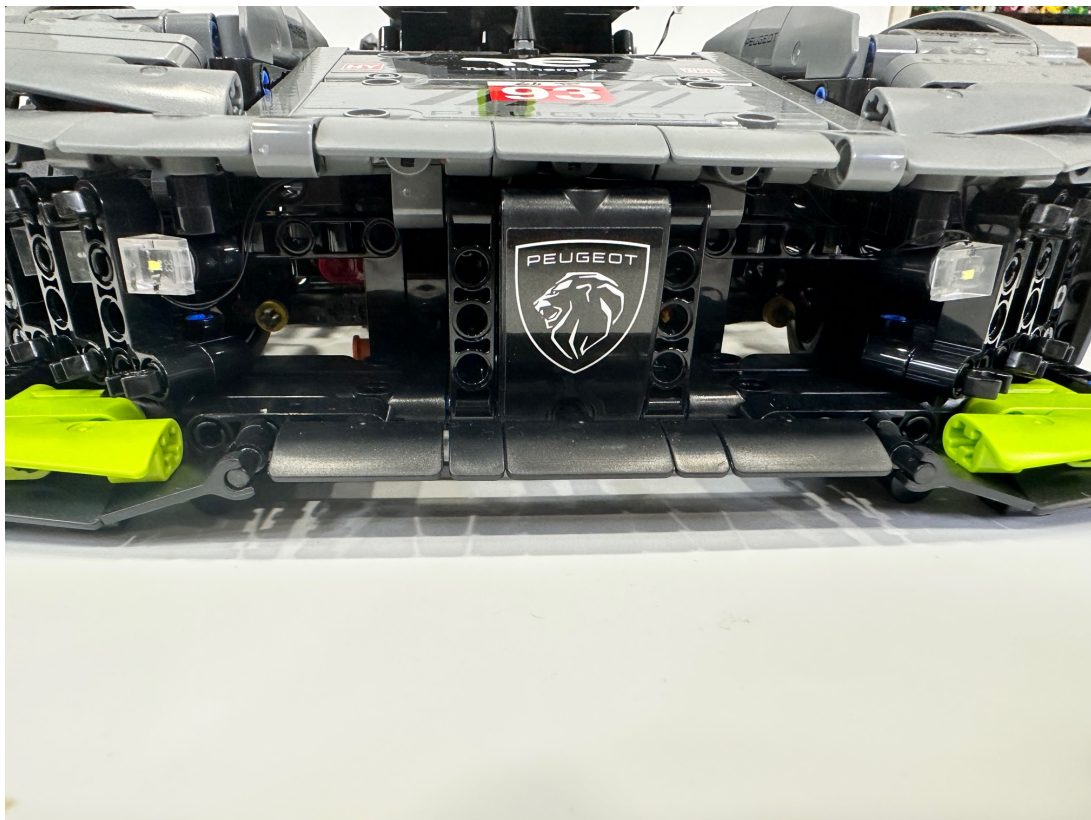

Now it's turn for the front, remove the white bars at the front light and replace the slopes by the lighting parts

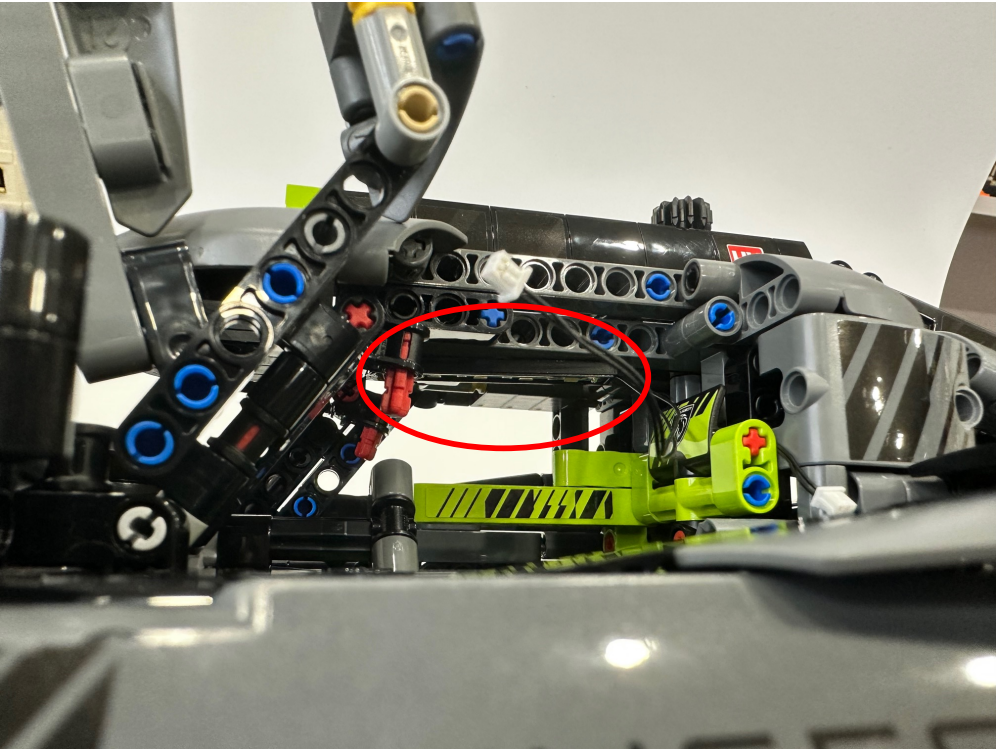

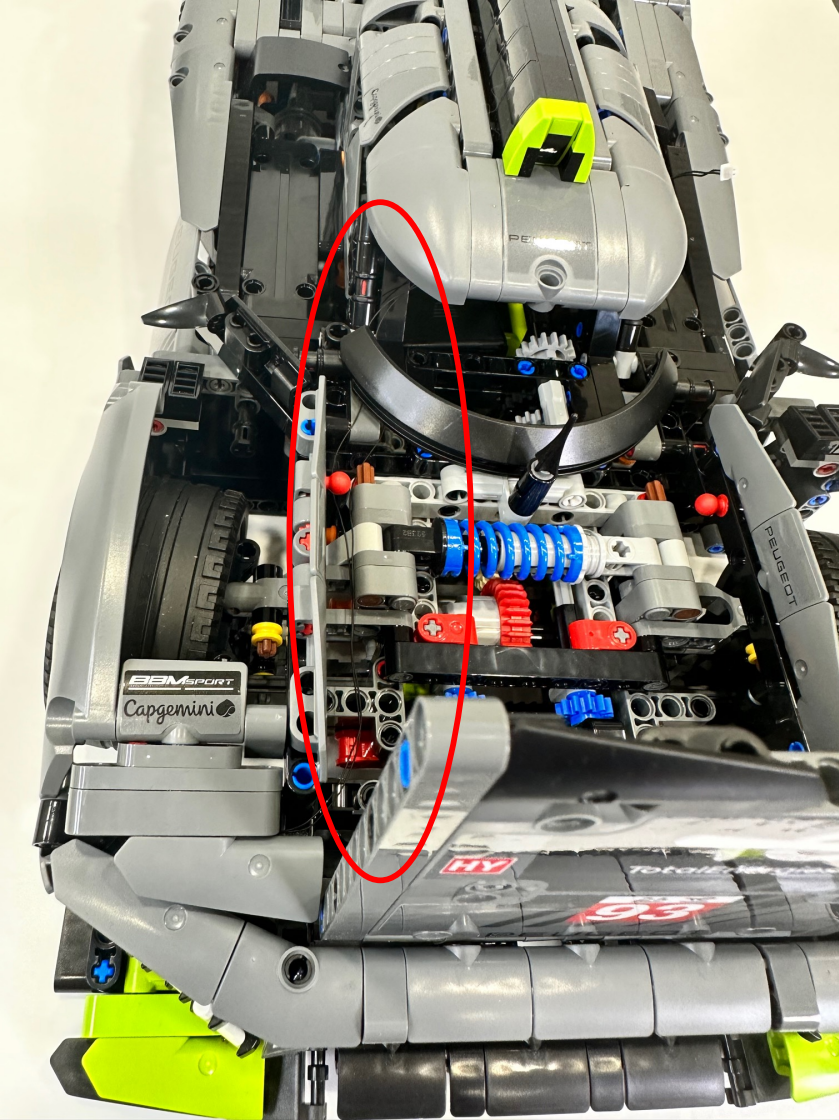

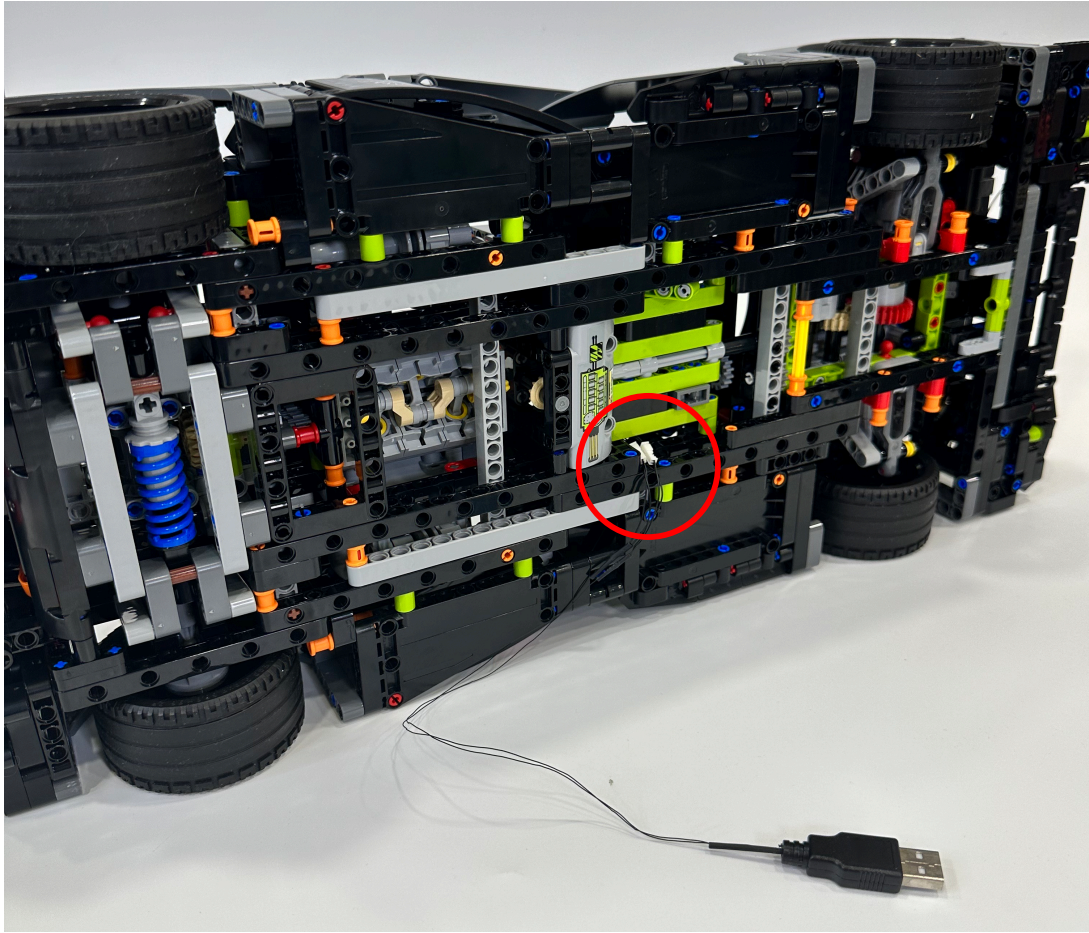

Do the same procedure for the other side, then hide the wires in between them on top of the front logo area

For the remain lighting tile, open the front cover and move it inside the seat area
Then stick it on the top as shown

To power by USB, connect the USB cable with the connectors at the bottom of the car

If powered by battery, connect the plugs with the battery case, then place the case on the seat
