

Lego 10356

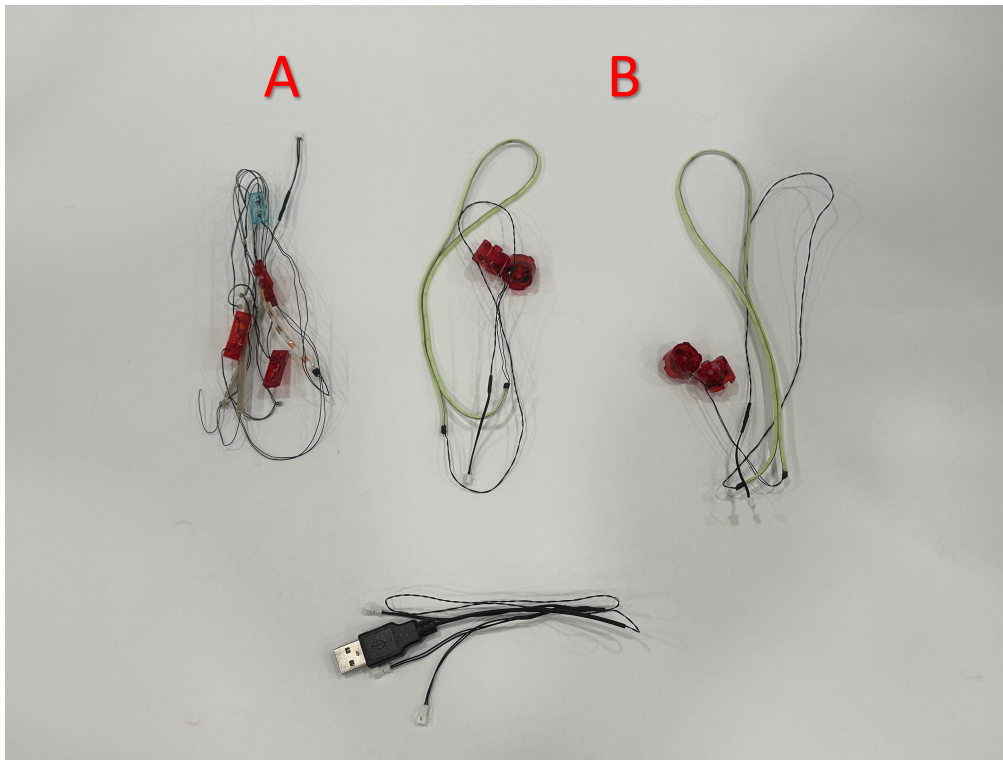

STAR TREK

U.S.S. Enterprise

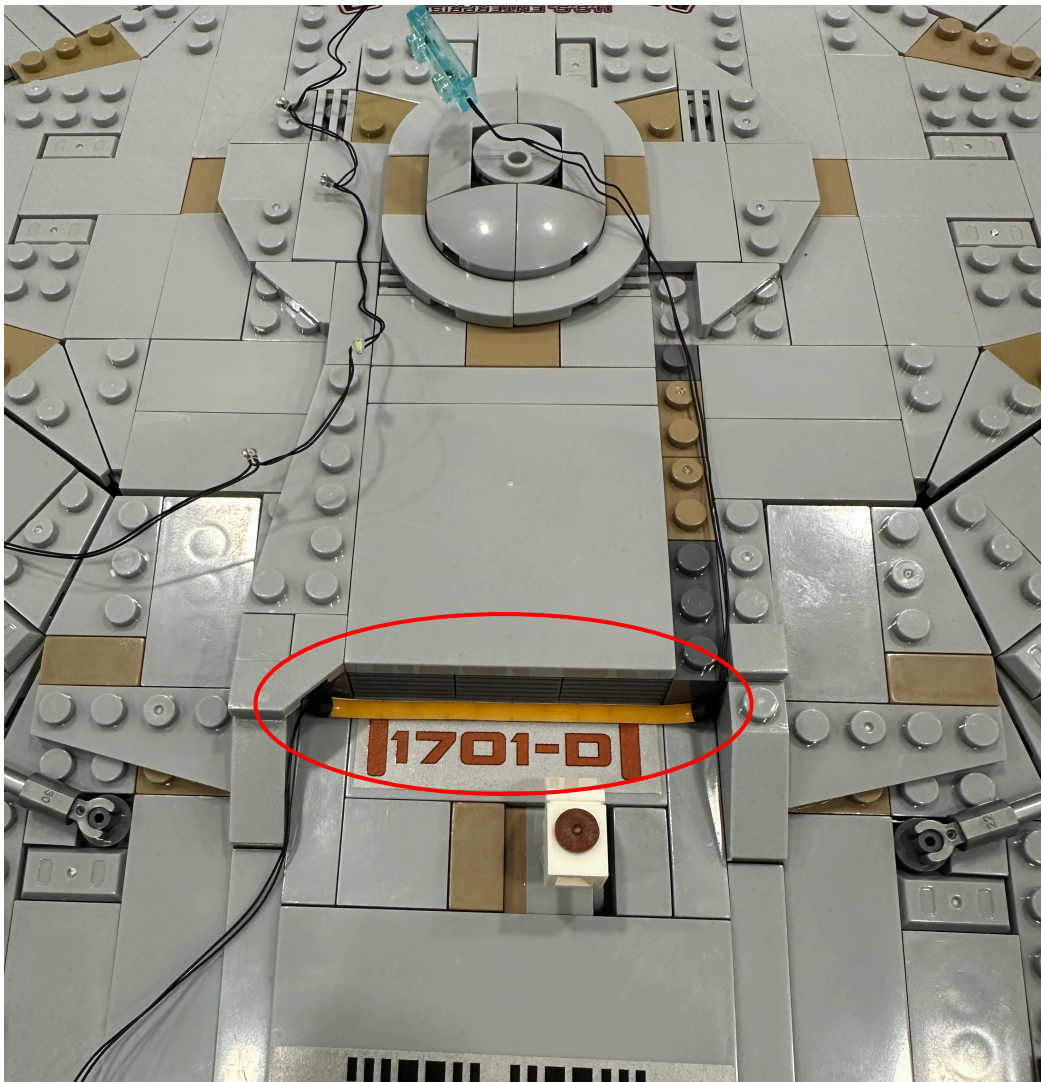

NCC-1701-D

Installation Guide

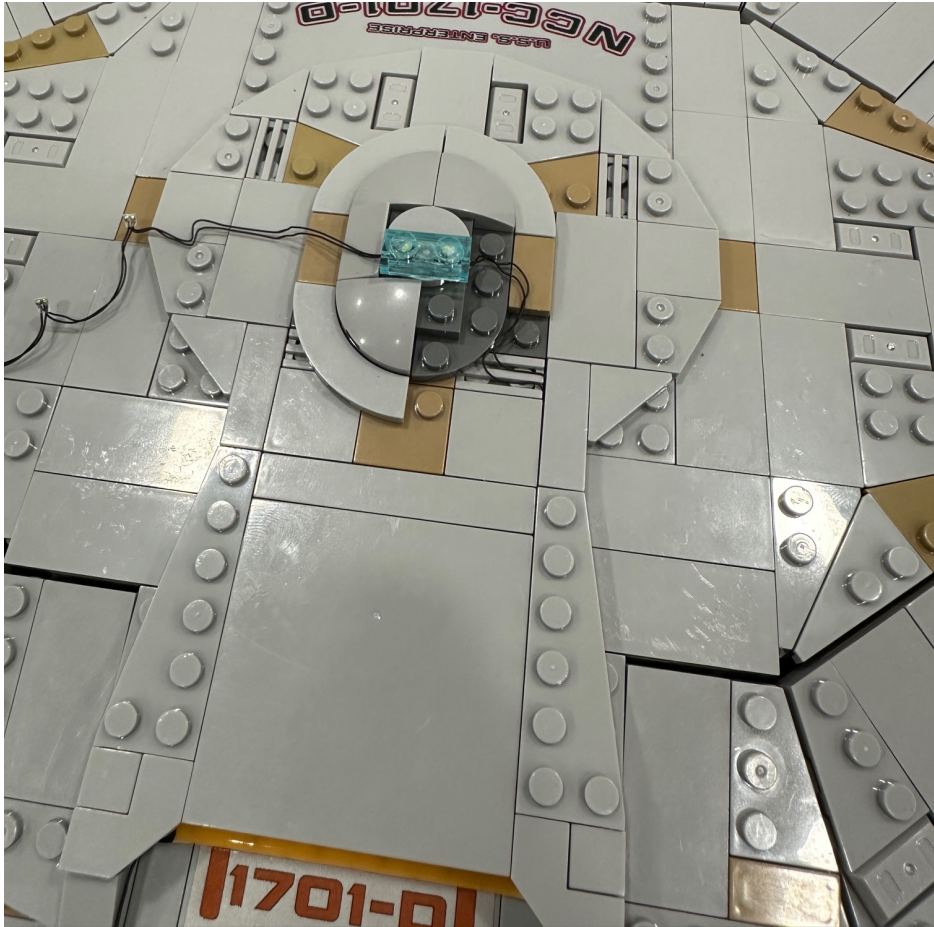

Get the led strip of lighting part A, stick it behind the “1701-D” then remove the shown plates on the side and move the 1x2 blue lighting plates to the middle

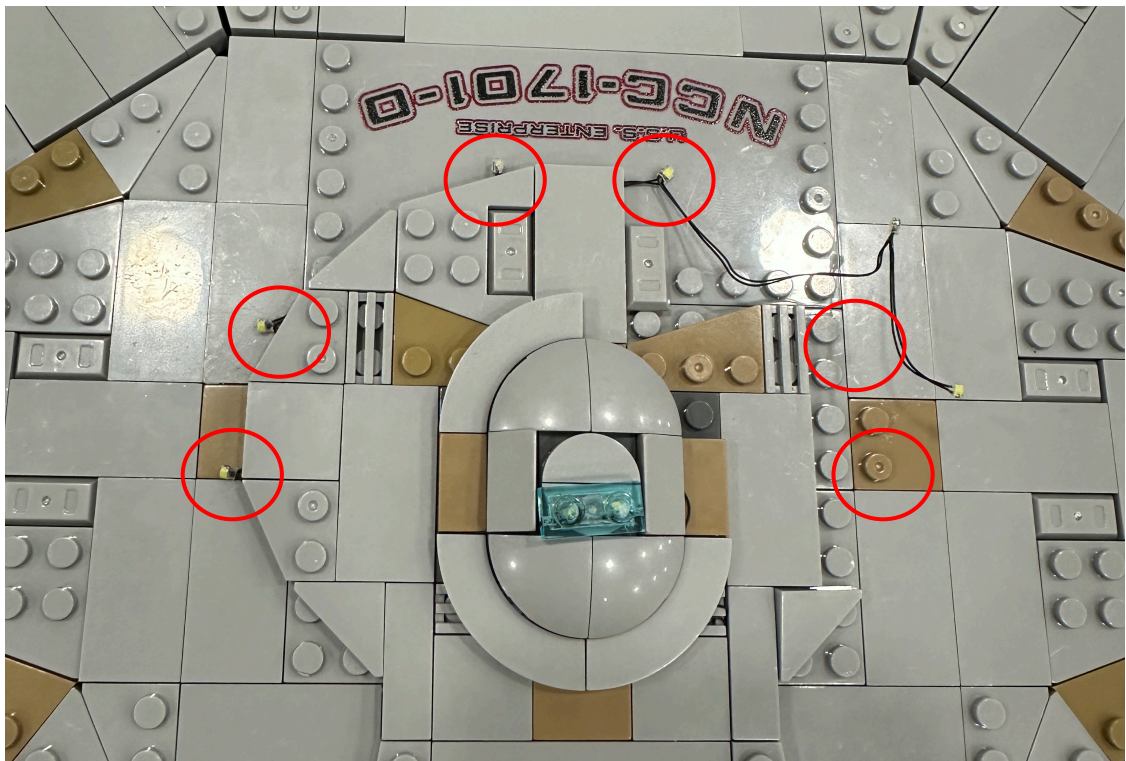

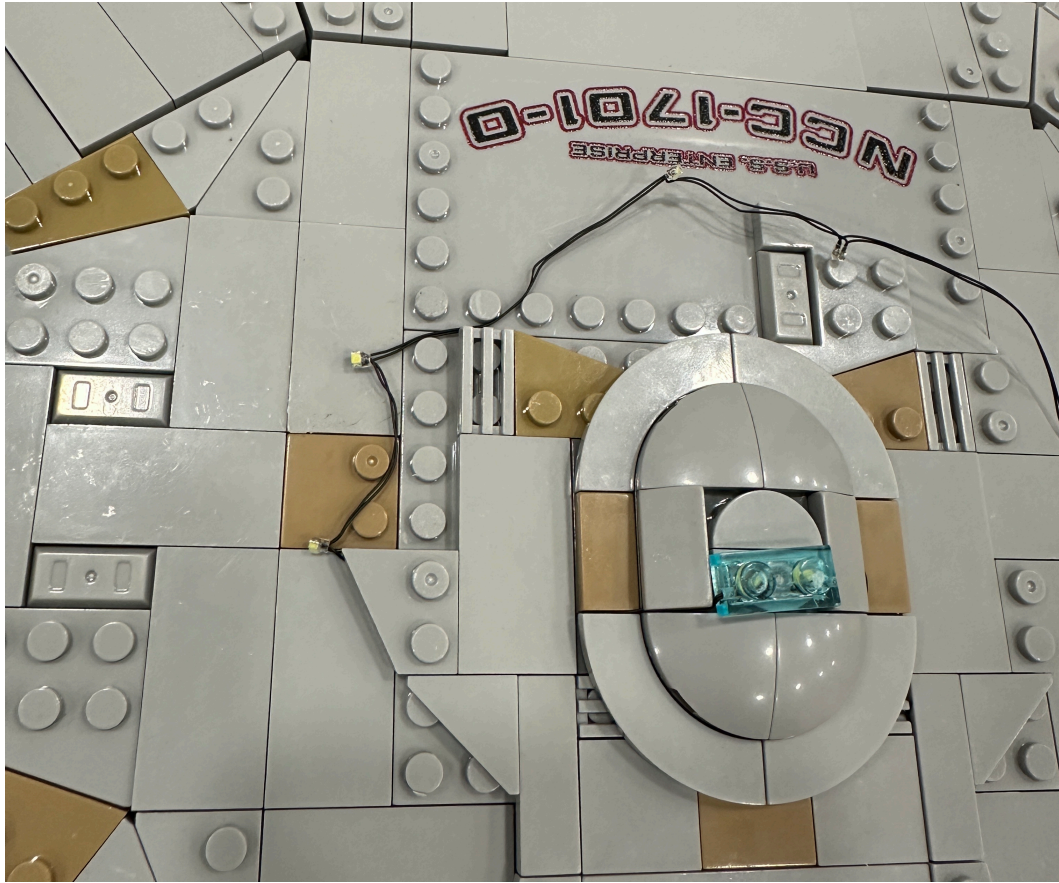

Assemble the blue lighting plate on top then restore the removed plates to stable the wire (beware the wire must NOT be placed on top of the studs)

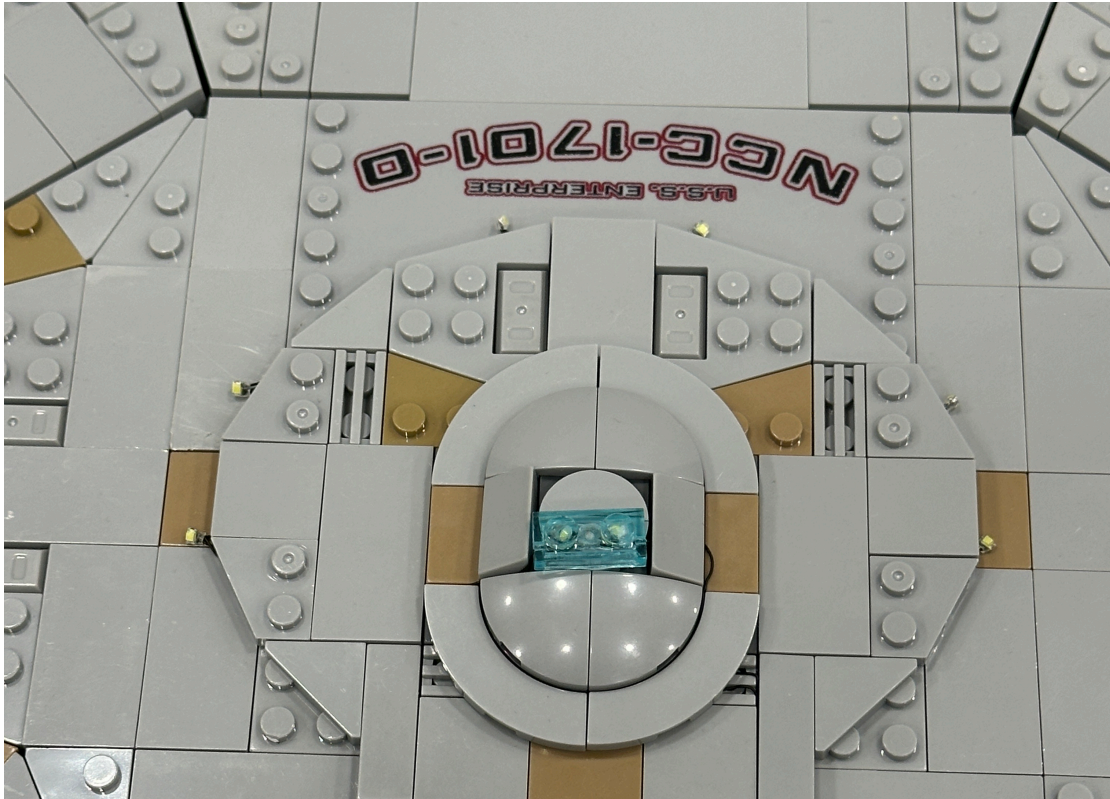

Then remove the plates on tiles on the shown side to place the led bulbs around the deck

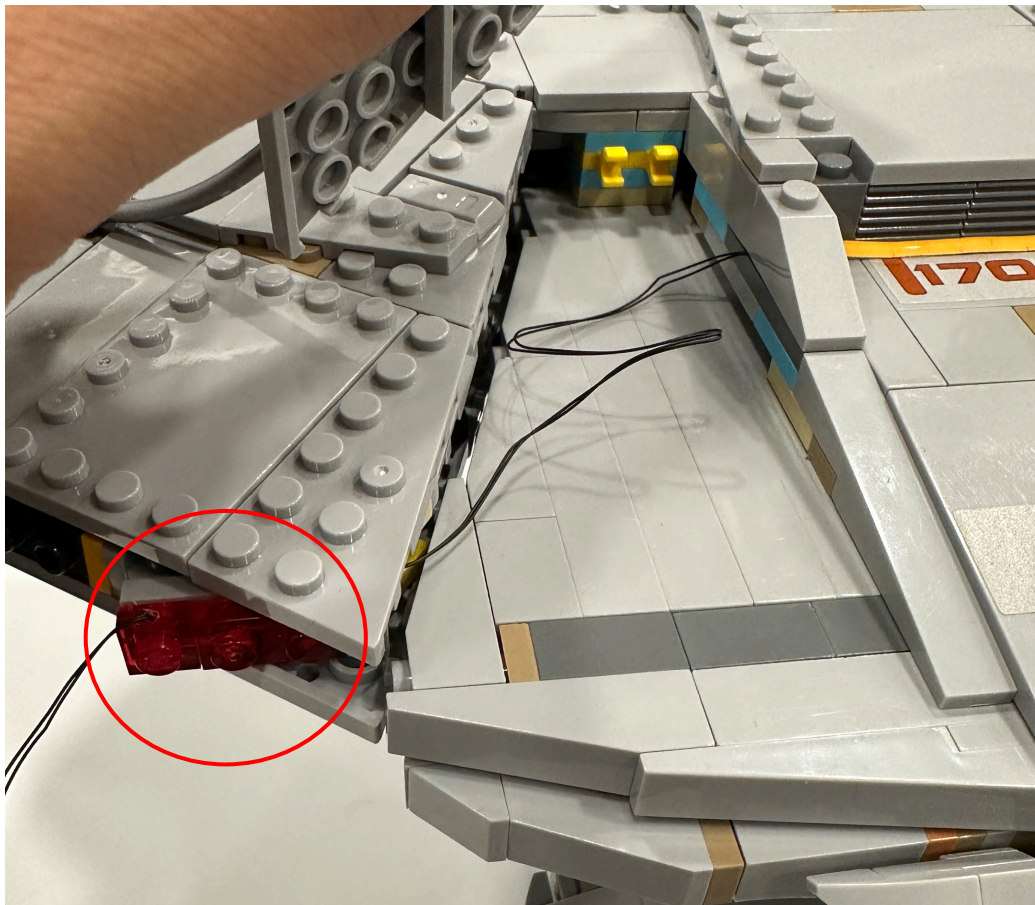

The 6pcs of led bulbs would be placed at where the red circles are

Restore the plates and tiles after the led bulbs are settled

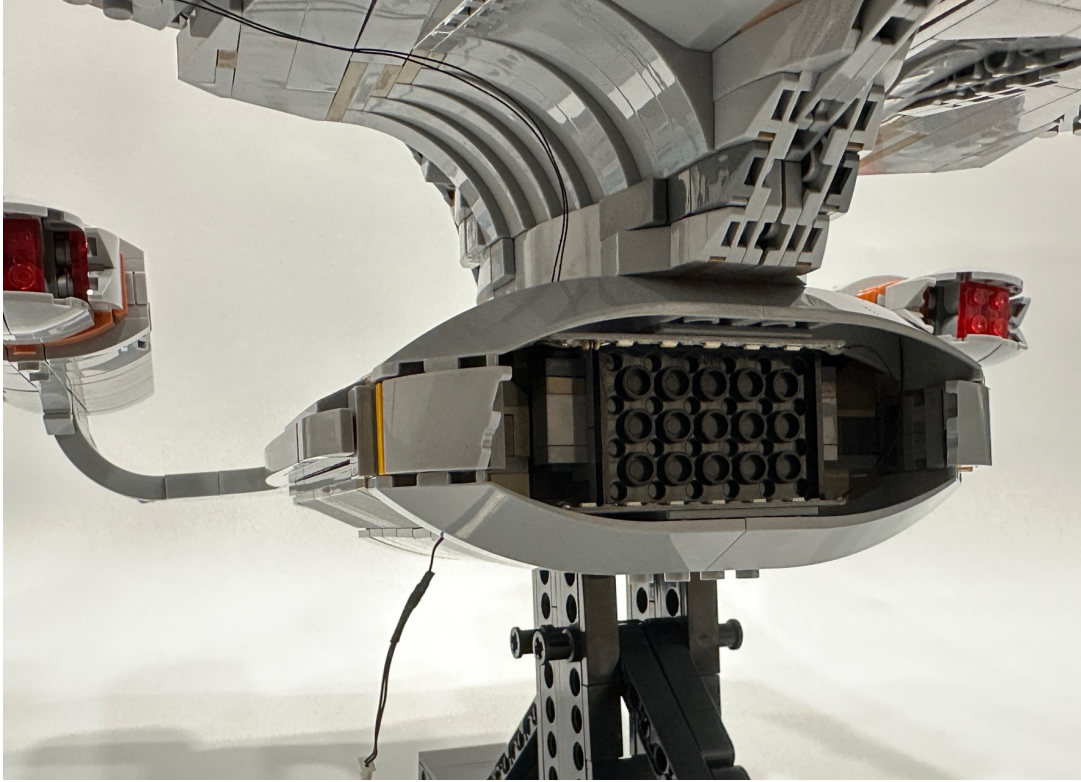

Back to the led strip, place the red lighting plates to the side and replace the red plates, wires would be hidden under the plates

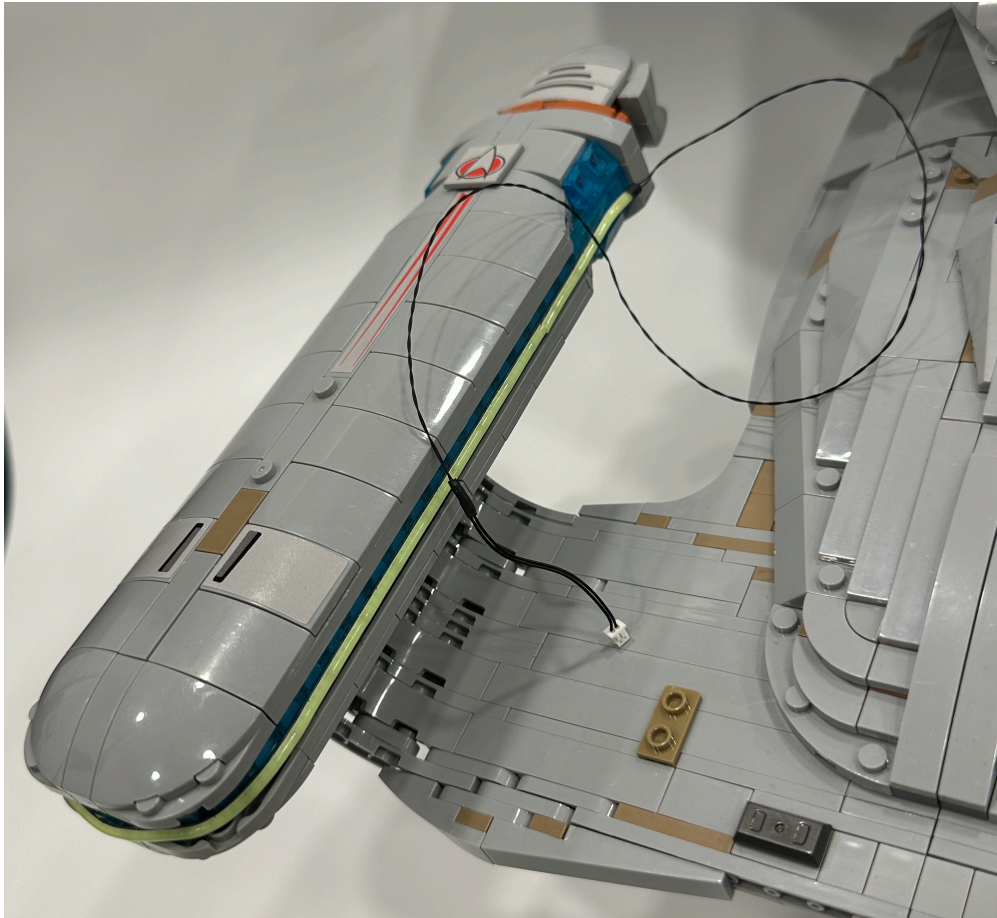

Replace the rest 2 sets of red plates by the lighting plates and place the wires in between the gap of the bricks

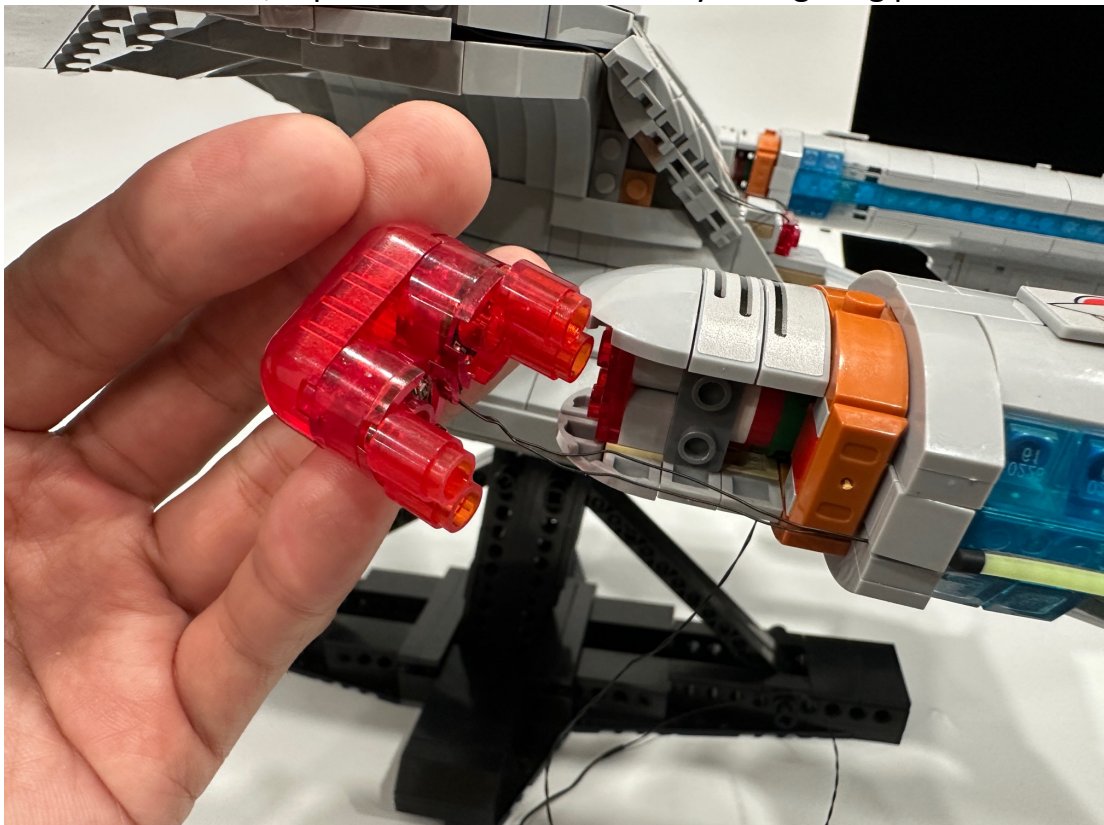

Remove the blue plates and stick the led plates inside the ship as shown
Then place the connector out of the ship by the gap and restore the blue plates

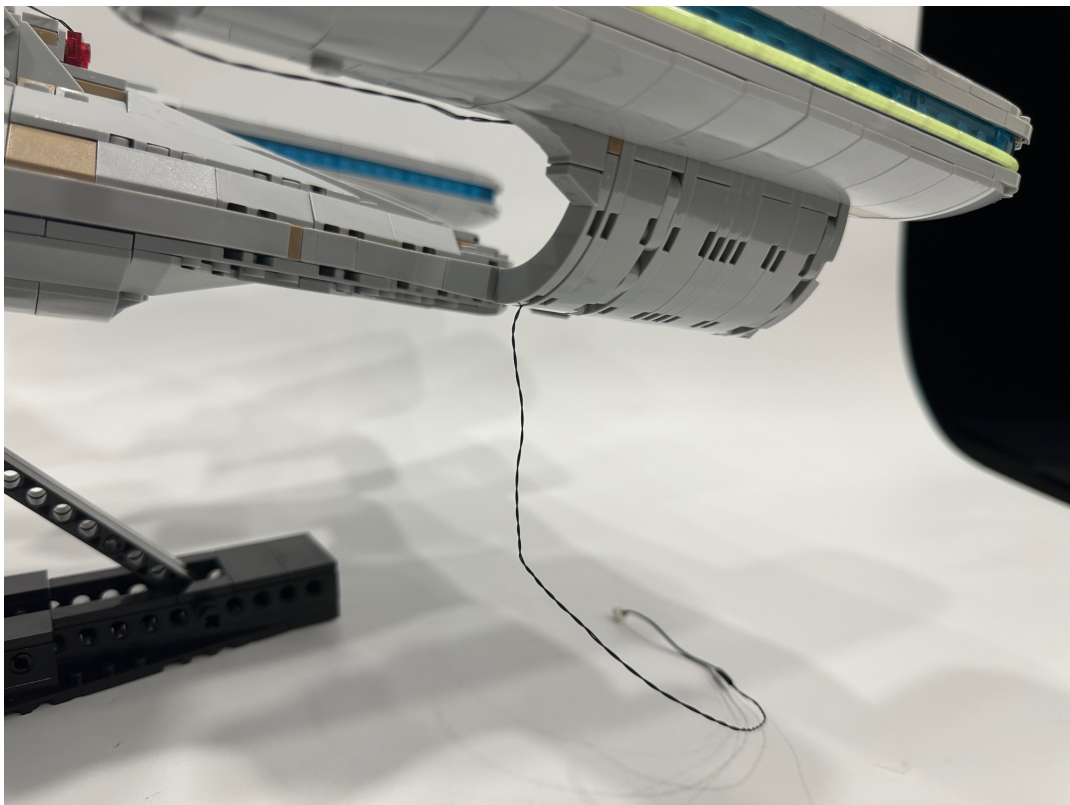

Get the lighting part B, stick the led strips around the side wing and remember the connector should face to the body as shown

For the other end, replace the 2 round bricks by the lighting parts

Restore the parts to cover the wire, then place the wire with connector
to the bottom and stable by the tile
After that you may assemble the other side

At last, gather three connectors and connect with the USB cable
